## Outline

### Part I: What is R, where did it come from, why use it

- Installing R and adding packages: the building blocks of R

### Part II: A brief introduction – an overview

- R is just a fancy (very fancy) calculator
- Descriptive data analysis
- Some inferential analysis

## Basic R capabilities: Calculation, Statistical tables

Basic R commands – remember don't enter the >

R is just a fancy calculator. Add, subtract, sum, products, group

$\geq 2 + 2$       #sum two numbers

```
[1] 4      #show the output
```

$> 3^4$     #3 raised to the 4th

```
[1] 81      #that was easy
```

```
> sum(1:10) #find the sum of the first 10 numbers
```

```
[1] 55 #the answer
```

```
> prod(c(1, 2, 3, 5, 7)) #the product of the concatenated (c) numbers
```

```
[1] 210 #Note how we combined product with concatenate
```

It is also a statistics table (the normal distribution, the t, the F, the  $\chi^2$  distribution, the xyz distribution)

```
> pnorm(q = 1) #the probability of a normal with value of 1 sd
```

```
[1] 0.8413447 #
```

```
> pt(q = 2, df = 20) #what about the probability of a t-test value of
```

```
[1] 0.9703672 #this is the upper tail
```

Basic R capabilities: Calculation, Statistical tables

## R is a set of distributions. Don't buy a stats book with tables!

**Table:** To obtain the density, prefix with *d*, probability with *p*, quantiles with *q* and to generate random values with *r*. (e.g., the normal distribution may be chosen by using *dnorm*, *pnorm*, *qnorm*, or *rnorm*.) Each function can be modified with various parameters.

| Distribution               | base name      | P 1             | P 2              | P 3          | example application                  |
|----------------------------|----------------|-----------------|------------------|--------------|--------------------------------------|
| <i>Normal</i>              | <i>norm</i>    | <i>mean</i>     | <i>sigma</i>     |              | Most data                            |
| <i>Multivariate normal</i> | <i>mvnorm</i>  | <i>mean</i>     | <i>r</i>         | <i>sigma</i> | Most data                            |
| <i>Log Normal</i>          | <i>lnorm</i>   | <i>log mean</i> | <i>log sigma</i> |              | income or reaction time              |
| <i>Uniform</i>             | <i>unif</i>    | <i>min</i>      | <i>max</i>       |              | rectangular distributions            |
| <i>Binomial</i>            | <i>binom</i>   | <i>size</i>     | <i>prob</i>      |              | Bernoulli trials (e.g. coin flips)   |
| <i>Student's t</i>         | <i>t</i>       | <i>df</i>       |                  | <i>nc</i>    | Finding significance of a t-test     |
| <i>Multivariate t</i>      | <i>mvt</i>     | <i>df</i>       | <i>corr</i>      | <i>nc</i>    | Multivariate applications            |
| <i>Fisher's F</i>          | <i>f</i>       | <i>df1</i>      | <i>df2</i>       | <i>nc</i>    | Testing for significance of F test   |
| $\chi^2$                   | <i>chisq</i>   | <i>df</i>       |                  | <i>nc</i>    | Testing for significance of $\chi^2$ |
| <i>Exponential</i>         | <i>exp</i>     | <i>rate</i>     |                  |              | Exponential decay                    |
| <i>Gamma</i>               | <i>gamma</i>   | <i>shape</i>    | <i>rate</i>      | <i>scale</i> | distribution theory                  |
| <i>Hypergeometric</i>      | <i>hyper</i>   | <i>m</i>        | <i>n</i>         | <i>k</i>     |                                      |
| <i>Logistic</i>            | <i>logis</i>   | <i>location</i> | <i>scale</i>     |              | Item Response Theory                 |
| <i>Poisson</i>             | <i>pois</i>    | <i>lambda</i>   |                  |              | Count data                           |
| <i>Weibull</i>             | <i>weibull</i> | <i>shape</i>    | <i>scale</i>     |              | Reaction time distributions          |

Basic R capabilities: Calculation, Statistical tables

## An example of using r, p, and q for a distributions

R code

```
set.seed(42) #set the random seed to get the same sequence
x <- rnorm(5) #find 5 randomly distributed normals
round(x,2) #show them, rounded to 2 decimals
round(pnorm(x),2) #show their probabilities to 2 decimals
round(qnorm(pnorm(x)),2) #find the quantiles of the normal
```

Produces this output

```
> set.seed(42) #set the random seed to get the same sequence
> x <- rnorm(5) #find 5 randomly distributed normals
> round(x,2) #show them, rounded to 2 decimals
[1] 1.37 -0.56  0.36  0.63  0.40
> round(pnorm(x),2) #show their probabilities to 2 decimals
[1] 0.91 0.29 0.64 0.74 0.66
> round(qnorm(pnorm(x)),2) #find the quantiles of the normal
[1] 1.37 -0.56  0.36  0.63  0.40
```

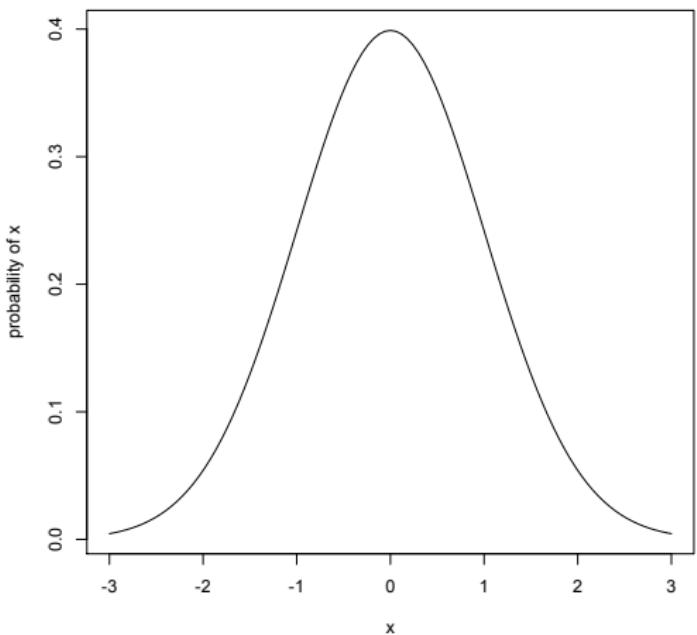

See ( Example 2)

## Basic Graphics

## R can draw distributions

### A normal curve

We do this by using the curve function to which we pass the values of the dnorm function.

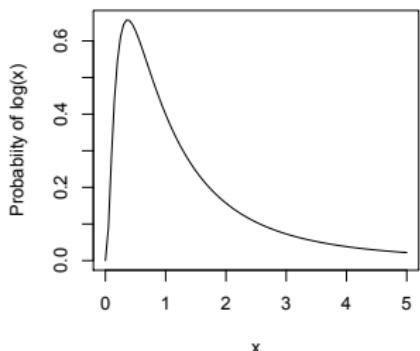

```
curve(dnormal(x),-3,3,  
ylab="probability of  
x",main="A normal  
curve")
```

(Example 3)

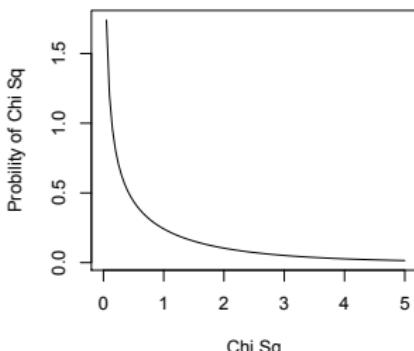

## R can draw more interesting distributions

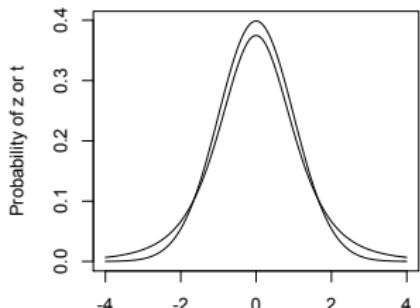

Log normal

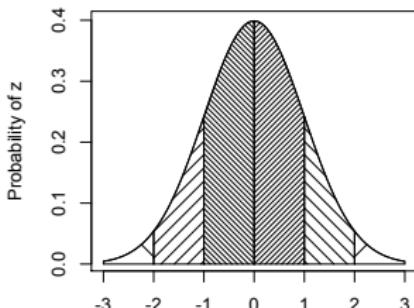

Chi Square distribution

Normal and t with 4 df

The normal curve

## Basic Graphics

## R is also a graphics calculator

R code

```

op <- par(mfrow=c(2,2))           #set up a 2 x 2 graph
curve(dlnorm(x),0,5,ylab='Probability of log(x)',main='Log normal')
curve(dchisq(x,1),0,5,ylab='Probability of Chi Sq',xlab='Chi Sq',main='Chi Square distribution')
curve(dnorm(x),-4,4,ylab='Probability of z or t',xlab='z or t',main='Normal and t with 4 df')
curve(dt(x, 4), add=TRUE)
#
#somewhat more complicated
#first draw the normal curve
curve(dnorm(x), -3,3,xlab="",ylab="Probability of z") #the range of x
title(main="The normal curve",outer=FALSE) #the title
#add the cross hatching by using polygons
xvals <- seq(-3,-2,length=100) #From -3 to 2 with 100 points
dvals <- dnorm(xvals)
polygon(c(xvals,rev(xvals)),c(rep(0,100),rev(dvals)),density=2,angle=-45)
xvals <- seq(-2,-1,length=100)
dvals <- dnorm(xvals)
polygon(c(xvals,rev(xvals)),c(rep(0,100),rev(dvals)),density=14,angle=45)
xvals <- seq(-1,-0,length=100)
dvals <- dnorm(xvals)
polygon(c(xvals,rev(xvals)),c(rep(0,100),rev(dvals)),density=34,angle=-45)
xvals <- seq(2,3,length=100)
dvals <- dnorm(xvals)
polygon(c(xvals,rev(xvals)),c(rep(0,100),rev(dvals)),density=2,angle=45)
xvals <- seq(1,2,length=100)
dvals <- dnorm(xvals)
polygon(c(xvals,rev(xvals)),c(rep(0,100),rev(dvals)),density=14,angle=-45)
xvals <- seq(0,1,length=100)
dvals <- dnorm(xvals)
polygon(c(xvals,rev(xvals)),c(rep(0,100),rev(dvals)),density=34,angle=45)
op <- par(mfrow=c(1,1)) #back to a normal 1 x 1 graph

```

## Basic Graphics

R can help teach with 100s of example data sets.

```
> data()
```

1. This opens up a separate text window and lists all of the data sets in the currently loaded packages.

```
> data(package="psych")
```

#see the names of the 56 s

26. Show the data sets available in a particular package (e.g., *psych*).

```
> data(Titanic)
```

3. Gets the particular data set with its help file (e.g., the survival rates on the Titanic cross classified by age, gender and class).

## > ? Titanic

4. Another original data set used by “student” (Gossett) for the t-test.

```
> data(cush)
```

5. The UC Berkeley example of "sex discrimination" as a Simpson paradox

```
> data(UCBAdmissions)
```

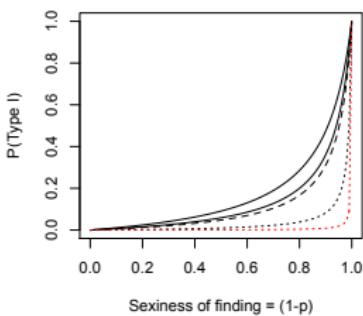

$\geq$  ? *UCBAdmissions*

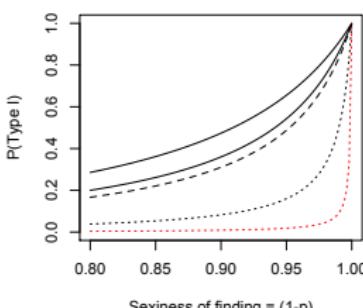

## R can show current statistical concepts:

Type I Errors: It is not the power, it is the prior likelihood  
 dashed/dotted lines reflect alpha = .05, .01, .001 with power = 1

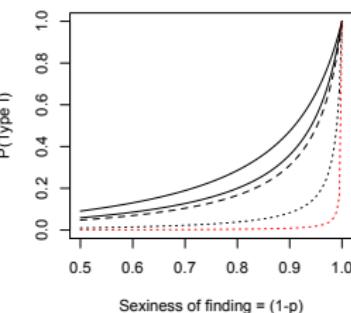

P(Type I) given alpha, power, sexiness

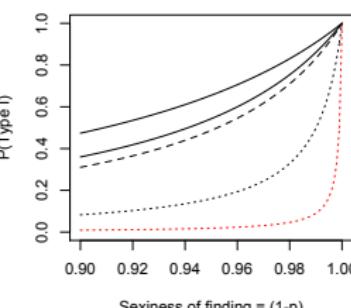

P(Type I) given alpha, power, sexiness

P(Type I) given alpha, power, sexiness

P(Type I) given alpha, power, sexiness

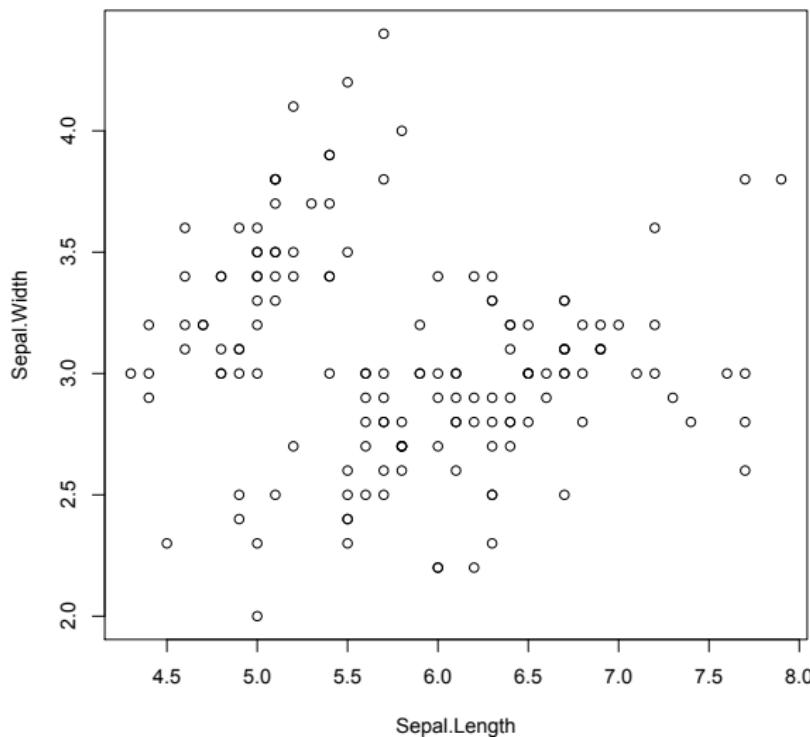

1. Extreme claims require extreme probabilities
2. Given that a finding is “significant”, what is the likelihood that it is a Type I error?
3. Depends upon the prior likelihood (the ‘sexiness’) of the claim.

## Basic Graphics

## A simple scatter plot using `plot` with Fisher's Iris data set.

Fisher Iris data

**R code**

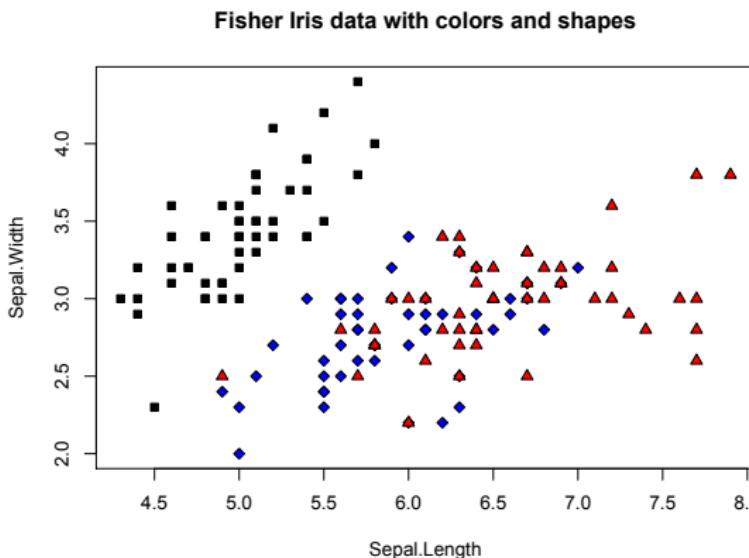

```
plot(iris[1:2], xlab="Sepal.Length",  
     ylab="Sepal.Width",  
     main="Fisher Iris data")
```

### Set parameters

1. `xlab` for x axis label
2. `ylab` for y axis label
3. `main` for title
4. (Example 4)

## A simple scatter plot using `plot` with some colors and shapes

### R code

```
plot(iris[1:2], xlab="Sepal.Length",
     ylab="Sepal.Width",
     main="Fisher Iris data with
     colors and shapes",
     bg=c("black", "blue",
     "red")[iris[, "Species"]],
     pch=21+ as.numeric(iris[, 5]))
```

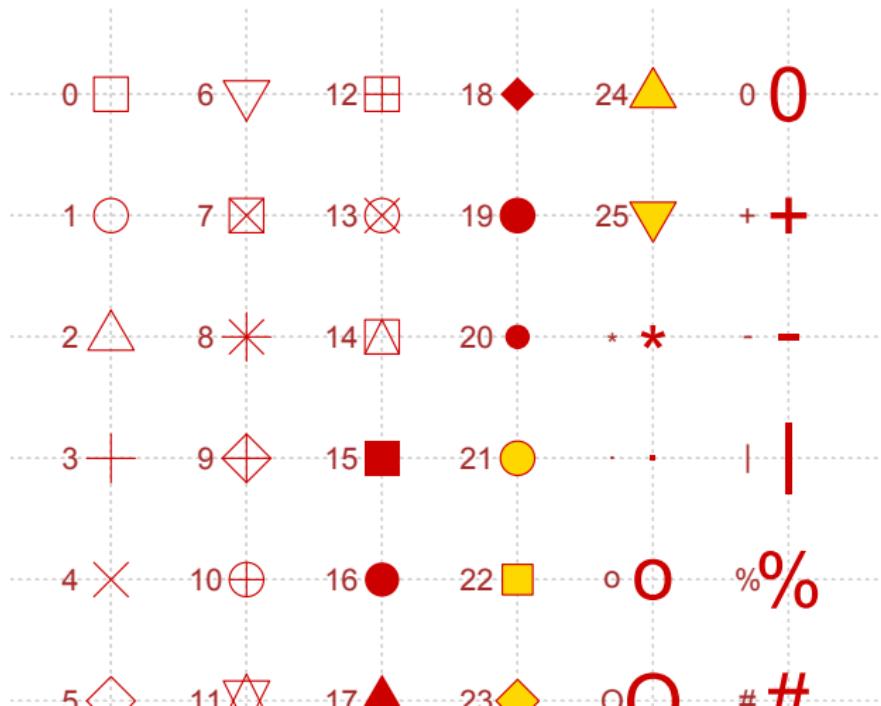

### Set parameters

1. `bg` for background colors of symbols
2. `pch` chooses the plot character
3. Note how these depend upon `iris[,5]` which is the species

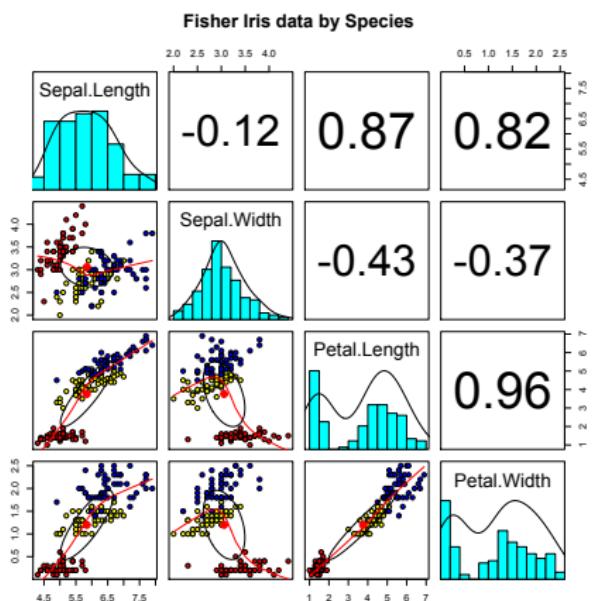

## Show the various graphic options for plot character (pch)

**plot symbols : points (... pch = \*, cex = 3 )**

## A scatter plot matrix plot with loess regressions using pairs.panels

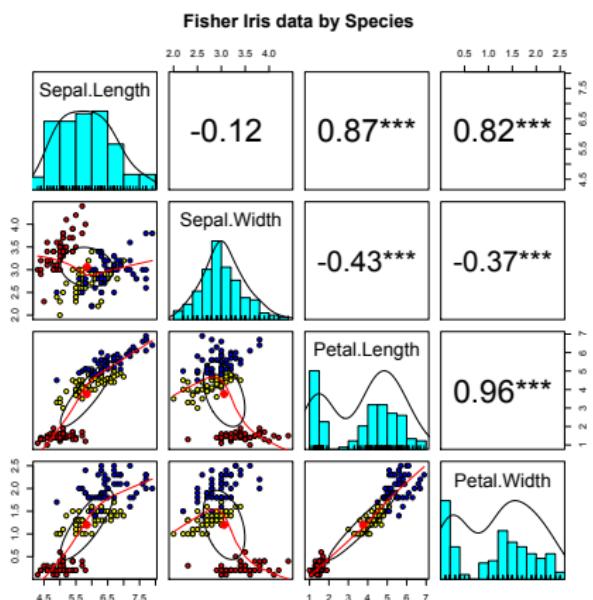

1. Correlations above the diagonal
2. Diagonal shows histograms and densities
3. scatter plots below the diagonal with correlation ellipse
4. locally smoothed (loess) regressions for each pair
5. optional color coding of grouping variables.

```
pairs.panels(iris[1:4], bg=c("red", "yellow", "blue")
[iris$Species], pch=21, main="Fisher Iris data by
Species")
```

## A scatter plot matrix plot with loess regressions using pairs.panels

Show “significance” using magic asterisks

```
pairs.panels(iris[1:4], bg=c("red", "yellow", "blue")
[iris$Species], pch=21, main="Fisher Iris data by
Species", stars=TRUE)
```

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

## A brief example with real data - example 5

1. Get the data
2. Descriptive statistics
  - Graphic
  - Numerical
3. Inferential statistics using the linear model
  - regressions
4. More graphic displays

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

## Get the data and describe it

- First read the data, either from a built in data set, a local file, a remote file, or from the clipboard.
- Describe the data using the `describe` function from *psych*

R code

```
my.data <- sat.act #an example data file that is part of psych
#or
#my.data <-read.file() #look for it on your hard drive
#or
file.name <-"http://personality-project.org/r/aps/sat.act.txt"
#now read it either locally or remotely
my.data <- read.file(file.name)
#or if you have copied the data to the clipboard
# my.data <- read.clipboard() #you can read it from there
describe(my.data) #report basic descriptive statistics
```

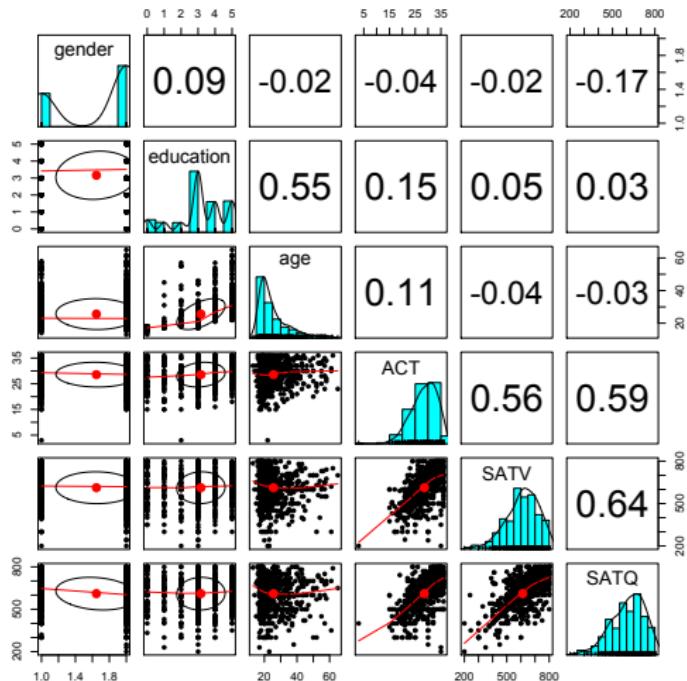

|           | var | n   | mean   | sd     | median | trimmed | mad    | min | max | range | skew  | kurtosis | se   |
|-----------|-----|-----|--------|--------|--------|---------|--------|-----|-----|-------|-------|----------|------|
| gender    | 1   | 700 | 1.65   | 0.48   | 2      | 1.68    | 0.00   | 1   | 2   | 1     | -0.61 | -1.62    | 0.02 |
| education | 2   | 700 | 3.16   | 1.43   | 3      | 3.31    | 1.48   | 0   | 5   | 5     | -0.68 | -0.06    | 0.05 |
| age       | 3   | 700 | 25.59  | 9.50   | 22     | 23.86   | 5.93   | 13  | 65  | 52    | 1.64  | 2.47     | 0.36 |
| ACT       | 4   | 700 | 28.55  | 4.82   | 29     | 28.84   | 4.45   | 3   | 36  | 33    | -0.66 | 0.56     | 0.18 |
| SATV      | 5   | 700 | 612.23 | 112.90 | 620    | 619.45  | 118.61 | 200 | 800 | 600   | -0.64 | 0.35     | 4.27 |
| SATQ      | 6   | 687 | 610.22 | 115.64 | 620    | 617.25  | 118.61 | 200 | 800 | 600   | -0.59 | 0.00     | 4.41 |

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

## Graphic display of data using pairs.panels

`pairs.panels(my.data) #Note the outlier for ACT`

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

**Clean up the data using scrub. Use ?scrub for help on the parameters.**

We noticed an outlier in the ACT data in the previous graph (you always graph your data, don't you).

We also noticed that the minimum value for ACT was unlikely (of course, you always describe your data).

So we change any case below 4 on the ACT to be missing (NA).

R code

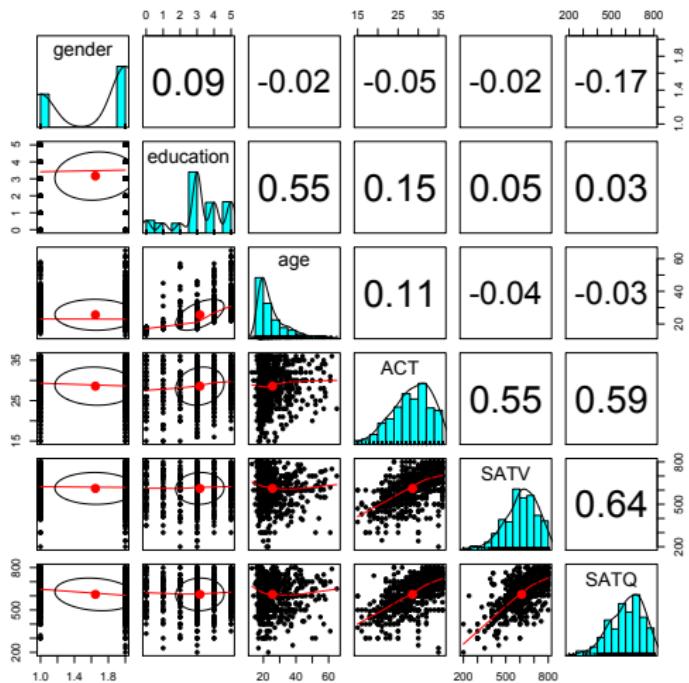

```
cleaned <- scrub(my.data, "ACT", min=4) #what data set,  
#which variable, what value to fix  
describe(cleaned) #look at the data again  
pairs.panels(cleaned)
```

|           | var | n   | mean   | sd     | median | trimmed | mad    | min | max | range | skew  | kurtosis | se   |
|-----------|-----|-----|--------|--------|--------|---------|--------|-----|-----|-------|-------|----------|------|
| gender    | 1   | 700 | 1.65   | 0.48   | 2      | 1.68    | 0.00   | 1   | 2   | 1     | -0.61 | -1.62    | 0.02 |
| education | 2   | 700 | 3.16   | 1.43   | 3      | 3.31    | 1.48   | 0   | 5   | 5     | -0.68 | -0.06    | 0.05 |
| age       | 3   | 700 | 25.59  | 9.50   | 22     | 23.86   | 5.93   | 13  | 65  | 52    | 1.64  | 2.47     | 0.36 |
| ACT       | 4   | 699 | 28.58  | 4.73   | 29     | 28.85   | 4.45   | 15  | 36  | 21    | -0.50 | -0.36    | 0.18 |
| SATV      | 5   | 700 | 612.23 | 112.90 | 620    | 619.45  | 118.61 | 200 | 800 | 600   | -0.64 | 0.35     | 4.27 |
| SATQ      | 6   | 687 | 610.22 | 115.64 | 620    | 617.25  | 118.61 | 200 | 800 | 600   | -0.59 | 0.00     | 4.41 |

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

## Graphic display of cleaned data using pairs.panels

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

## Find the pairwise correlations, round to 2 decimals

This also shows how two functions can be nested. We are rounding the output of the cor function.

R code

```
#specify all the parameters being passed
round(cor(x=sat.act,use="pairwise"),digits=2)
#the short way to specify the rounding parameter
round(cor(cleaned,use="pairwise"),2)
```

|           | gender | education | age   | ACT   | SATV  | SATQ  |
|-----------|--------|-----------|-------|-------|-------|-------|
| gender    | 1.00   | 0.09      | -0.02 | -0.05 | -0.02 | -0.17 |
| education | 0.09   | 1.00      | 0.55  | 0.15  | 0.05  | 0.03  |
| age       | -0.02  | 0.55      | 1.00  | 0.11  | -0.04 | -0.03 |
| ACT       | -0.05  | 0.15      | 0.11  | 1.00  | 0.55  | 0.59  |
| SATV      | -0.02  | 0.05      | -0.04 | 0.55  | 1.00  | 0.64  |
| SATQ      | -0.17  | 0.03      | -0.03 | 0.59  | 0.64  | 1.00  |

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

## Display it differently using the lowerCor function

Operations that are done a lot may be made into your own functions. Thus, `lowerCor` finds the pairwise correlations, rounds to 2 decimals, displays the lower half of the correlation matrix, and then abbreviates the column labels to make them line up nicely

R code

```
lowerCor(cleaned)
```

|           | gendr | edctn | age   | ACT  | SATV | SATQ |
|-----------|-------|-------|-------|------|------|------|
| gender    | 1.00  |       |       |      |      |      |
| education | 0.09  | 1.00  |       |      |      |      |
| age       | -0.02 | 0.55  | 1.00  |      |      |      |
| ACT       | -0.05 | 0.15  | 0.11  | 1.00 |      |      |
| SATV      | -0.02 | 0.05  | -0.04 | 0.55 | 1.00 |      |
| SATQ      | -0.17 | 0.03  | -0.03 | 0.59 | 0.64 | 1.00 |

Data preparation, descriptive statistics, data cleaning, correlation plots: (Examples part ii)

## Testing the significance of one correlation using cor.test.

R code

```
cor.test(my.data$ACT, my.data$SATQ)
```

Pearson's product-moment correlation to correlate

```
data: my.data$ACT and my.data$SATQ
t = 18.9822, df = 685, p-value < 2.2e-16
alternative hypothesis: true correlation
is not equal to 0
95 percent confidence interval:
0.5358435 0.6340672
sample estimates:
cor
0.5871122
```

1. Specify the variables to correlate
2. Various statistics associated with the correlation.
3. But what if you want to do many tests?  
Use corr.test

## Inferential statistics

## Test many correlations for significance using corr.test

R code

corr.test(cleaned)

all:corr.test(x = cleaned)

Correlation matrix

|           | gender | education | age   | ACT   | SATV  | SATQ  |
|-----------|--------|-----------|-------|-------|-------|-------|
| gender    | 1.00   | 0.09      | -0.02 | -0.05 | -0.02 | -0.17 |
| education | 0.09   | 1.00      | 0.55  | 0.15  | 0.05  | 0.03  |
| age       | -0.02  | 0.55      | 1.00  | 0.11  | -0.04 | -0.03 |
| ACT       | -0.05  | 0.15      | 0.11  | 1.00  | 0.55  | 0.59  |
| SATV      | -0.02  | 0.05      | -0.04 | 0.55  | 1.00  | 0.64  |
| SATQ      | -0.17  | 0.03      | -0.03 | 0.59  | 0.64  | 1.00  |

Sample Size

|        | gender | education | age | ACT | SATV | SATQ |
|--------|--------|-----------|-----|-----|------|------|
| gender | 700    |           | 700 | 700 | 699  | 700  |
| ...    |        |           |     |     |      |      |
| SATQ   | 687    |           | 687 | 687 | 686  | 687  |

Probability values (Entries above the diagonal are  
adjusted for multiple tests.)

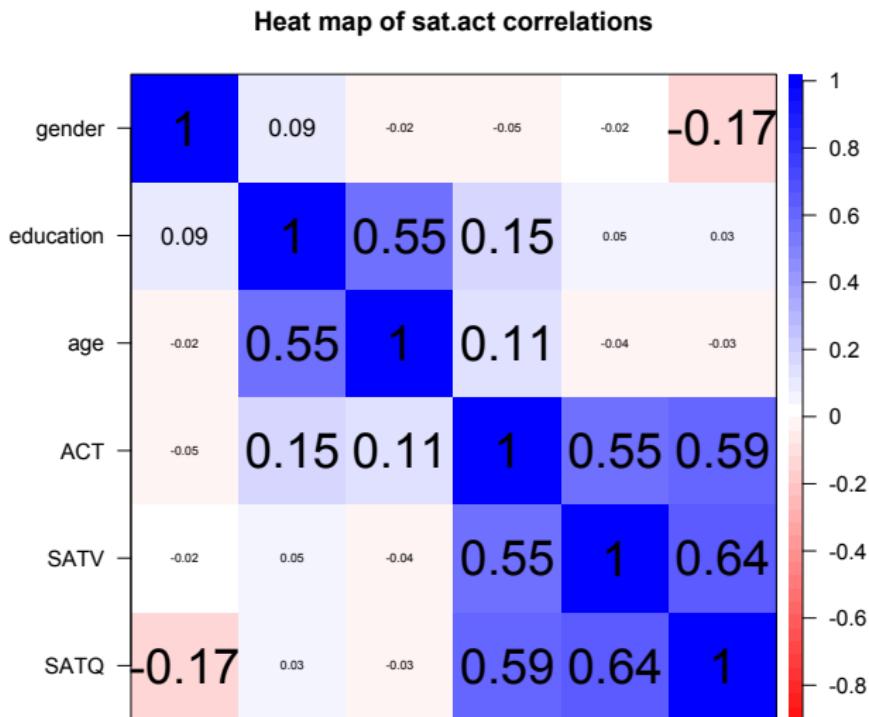

|           | gender | education | age  | ACT  | SATV | SATQ |

| gender    | 0.00   | 0.17      | 1.00 | 1.00 | 1    | 0    |
| education | 0.02   | 0.00      | 0.00 | 0.00 | 1    | 1    |
| age       | 0.58   | 0.00      | 0.00 | 0.03 | 1    | 1    |
| ACT       | 0.21   | 0.00      | 0.00 | 0.00 | 0    | 0    |
| SATV      | 0.00   | 0.00      | 0.00 | 0.00 | 0    | 0    |
| SATQ      | 0.00   | 0.00      | 0.00 | 0.00 | 0    | 0    |

## Inferential statistics

## The SAT.ACT correlations. Confidence values from resampling

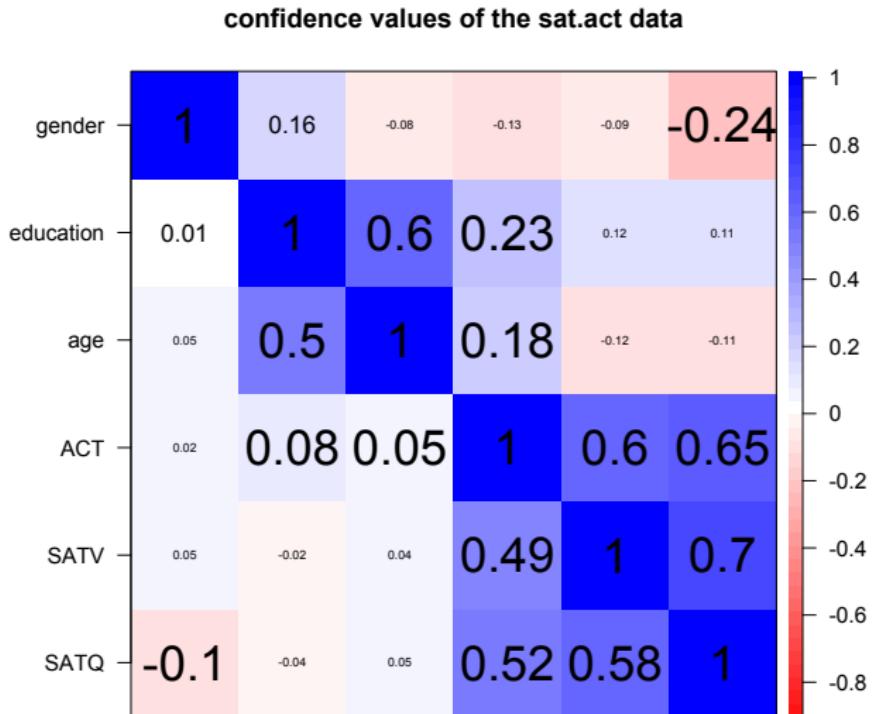

```
ci <- cor.ci(cleaned,main='Heat map of sat.act')
```

## Inferential statistics

## The SAT.ACT bootstrapped confidence intervals of correlation

```
cor.plot.upperLowerCi(ci,main="Heat map of sat.act")
```

## Inferential statistics

Are education and gender independent?  $\chi^2$  Test of association

```
T <- with(my.data, table(gender, education))
```

```
> T
```

|        |   | education |    |    |     |    |    |
|--------|---|-----------|----|----|-----|----|----|
|        |   | 0         | 1  | 2  | 3   | 4  | 5  |
| gender | 1 | 27        | 20 | 23 | 80  | 51 | 46 |
|        | 2 | 30        | 25 | 21 | 195 | 87 | 95 |

```
> chisq.test(T)
```

Pearson's Chi-squared test

2. Show the table

3. Apply  $\chi^2$  test

data: T

X-squared = 16.0851, df = 5, p-value = 0.006605

## Inferential statistics

Finding  $\chi^2$  from a table of data

- Consider the effect of a treatment on later arrest (From Ashley Kendall, 2016)

| Condition | Arrested | Not Arrested |
|-----------|----------|--------------|
| Control   | 14       | 21           |
| Treatment | 3        | 23           |

R code

```
ak.df <- data.frame(Control=c(14,21),Treated =c(3,23))
rownames(ak.df) <- c("Arrested","Not Arrested")
ak.df #show the data frame
chisq.test(ak.df) #Test it using the Yates continuity correction
```

```
> ak.df #show the data frame
      Control Treated
Arrested        14      3
Not Arrested    21     23
> chisq.test(ak.df) #Test it using the Yates continuity correction
Pearson's Chi-squared test with Yates' continuity correction
data: ak.df
X-squared = 4.6791, df = 1, p-value = 0.03053
```

## Inferential statistics

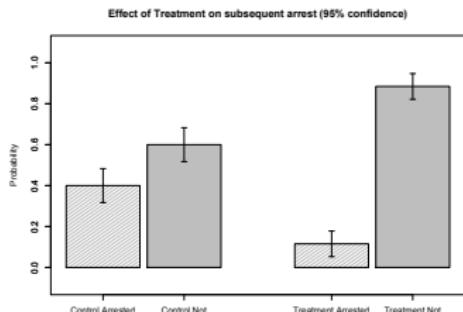

**Graph the tabled data showing confidence intervals of proportions**

## R code

```

ak.df <- data.frame(Control=c(14,21),Treated =c(3,23))
ak.p <- t(t(ak.df)/colSums(ak.df)) #convert to probabilities
standard.error <- sqrt(ak.p[1,] * ak.p[2,]/colSums(ak.df))
stats <- data.frame(mean=as.vector(ak.p),
                      se=rep(standard.error,each=2))
rownames(stats) <- c("Control Arrested","Control Not",
                      "Treatment Arrested","Treatment Not")
error.bars(stats=stats,bars=TRUE,space=c(.1,.1,1,.1),
            density=c(20,-10,20,-10),ylab="Probability",
            xlab="Control vs Treatment",
            main ="Effect of Treatment on subsequent arrest (95% confidence)")

```

```
round(stats, 2)           mean    se
Control Arrested      0.40  0.08
Control Not            0.60  0.08
Treatment Arrested   0.12  0.06
Treatment Not          0.88  0.06
```

## Multiple regression and the general linear model

1. Use the sat.act data example
2. Do the linear model
3. Summarize the results

R code

```
mod1 <- lm(SATV ~ education + gender + SATQ, data=my.data)
summary(mod1, digits=2)
```

```
Call:
lm(formula = SATV ~ education + gender + SATQ, data = my.data)

Residuals:
    Min      1Q  Median      3Q     Max 
-372.91   -49.08    2.30   53.68   251.93 

Coefficients:
            Estimate Std. Error t value Pr(>|t|)    
(Intercept) 180.87348   23.41019   7.726 3.96e-14 ***
education     1.24043    2.32361   0.534  0.59363    
gender        20.69271   6.99651   2.958  0.00321 **  
SATQ          0.64489    0.02891  22.309 < 2e-16 *** 
Signif. codes:  0 ‘***’ 0.001 ‘**’ 0.01 ‘*’ 0.05 ‘.’ 0.1 ‘ ’ 1
Residual standard error: 86.24 on 683 degrees of freedom
(13 observations deleted due to missingness)
Multiple R-squared:  0.4231,    Adjusted R-squared:  0.4205 
F-statistic: 167 on 3 and 683 DF,  p-value: < 2.2e-16
```

## Zero center the data before examining interactions

In order to examine interactions using multiple regression, we must first “zero center” the data. This may be done using the `scale` function. By default, `scale` will standardize the variables. So to keep the original metric, we make the scaling parameter `FALSE`.

R code

```
csat <- data.frame(scale(my.data,scale=FALSE))  
describe(csat) #centered not standardized data
```

|           | vars | n   | mean | sd     | median | trimmed | mad    | min     | max    |
|-----------|------|-----|------|--------|--------|---------|--------|---------|--------|
| gender    | 1    | 700 | 0    | 0.48   | 0.35   | 0.04    | 0.00   | -0.65   | 0.35   |
| education | 2    | 700 | 0    | 1.43   | -0.16  | 0.14    | 1.48   | -3.16   | 1.84   |
| age       | 3    | 700 | 0    | 9.50   | -3.59  | -1.73   | 5.93   | -12.59  | 39.41  |
| ACT       | 4    | 700 | 0    | 4.82   | 0.45   | 0.30    | 4.45   | -25.55  | 7.45   |
| SATV      | 5    | 700 | 0    | 112.90 | 7.77   | 7.22    | 118.61 | -412.23 | 187.77 |
| SATQ      | 6    | 687 | 0    | 115.64 | 9.78   | 7.04    | 118.61 | -410.22 | 189.78 |

Note that we need to take the output of `scale` (which comes back as a matrix) and make it into a `data.frame` if we want to use the linear model on it.

## Zero center the data before examining interactions

R code

```
csat <- data.frame(scale(my.data,scale=FALSE))  
mod2 <- lm(SATV ~ education * gender * SATQ,data=csat)  
summary(mod2)
```

```
Call:  
all:  
lm(formula = SATV ~ education * gender * SATQ, data = csat)
```

Residuals:

| Min     | 1Q     | Median | 3Q    | Max    |
|---------|--------|--------|-------|--------|
| -372.53 | -48.76 | 3.33   | 51.24 | 238.50 |

Coefficients:

|                       | Estimate  | Std. Error | t value | Pr(> t )     |
|-----------------------|-----------|------------|---------|--------------|
| (Intercept)           | 0.773576  | 3.304938   | 0.234   | 0.81500      |

## Show the regression lines by gender

First plot all the data.

Then add the regression lines.

Then put a title on the whole thing.

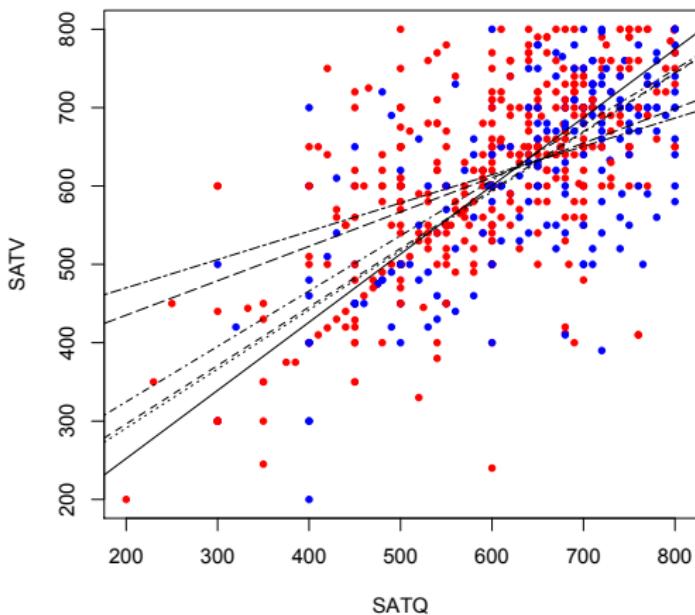

### R code

```
#first plot the data points
with(my.data, plot(SATV~SATQ,
  col=c("blue", "red") [gender]))
#add the regression lines
by(my.data, my.data$gender,
  function(x) abline
  (lm(SATV~SATQ, data=x),
   lty=c("solid", "dashed"
  )[x$gender]))
#add a title
title("Verbal varies by
  Quant and gender")
#label the lines
text(250, 320, "male")
text(250, 430, "female")
```

## Show the regression lines by education

Verbal varies by Quant  
and education

Do this again, but for  
levels of education as the  
moderator

**R code**

```
with(my.data, plot(SATV~SATQ,
                    col=c("blue", "red") [gender],
                    pch=20)) #plot character
by(my.data, my.data$education,
   function(x) abline
   (lm(SATV~SATQ,data=x),
    lty=c("solid", "dashed", "dotted",
    "dotdash", "longdash",
    "twodash") [(x$education+1)]))

title("Verbal varies by Quant  
and education")
```

## Questions?

4 steps: read, explore, test, graph

## Using R for psychological statistics: Basic statistics

### 1. Writing syntax

- For a single line, just type it
- Mistakes can be redone by using the up arrow key
- For longer code, use a text editor (built into some GUIs)

### 2. Data entry

- Using built in data sets for examples
- Copying from another program
- Reading a text or csv file
- Importing from SPSS or SAS
- Simulate it (using various simulation routines)

### 3. Descriptives

- Graphical displays
- Descriptive statistics
- Correlation

### 4. Inferential

- the t test
- the F test
- the linear model

4 steps: read, explore, test, graph

## Data entry overview

### 1. Using built in data sets for examples

- `data()` will list > 100 data sets in the `datasets` package as well as all sets in loaded packages.
- Most packages have associated data sets used as examples
- `psych` has > 50 example data sets

### 2. Copying from another program

- use copy and paste into R using `read.clipboard` and its variations

### 3. Reading a text or csv file

- read a local or remote file

### 4. Importing from SPSS or SAS

- Use either the `foreign`, `haven` or `rio` packages

### 5. Simulate it (using various simulation routines)

### 6. Model it using simulations (e.g., `cta` ([Revelle & Condon, 2015](#)))

4 steps: read, explore, test, graph

## Examples of built in data sets from the psych package

```
> data(package="psych")
```

|                  |   |
|------------------|---|
| ability          | 16 multiple choice IQ items from the ICAR project ( <a href="#">Condon &amp; Revelle, 2014</a> )  |
| Bechtoldt        | Seven data sets showing a bifactor solution<br>( <a href="#">Bechtoldt, 1961</a> ; <a href="#">Holzinger &amp; Swineford, 1937</a> ; <a href="#">Thurstone &amp; Thurstone, 1941</a> ). |
| Dwyer            | 8 cognitive variables used by <a href="#">Dwyer (1937)</a> for an example.  |
| Reise            | Seven data sets showing a bifactor solution ( <a href="#">Reise, Morizot &amp; Hays, 2007</a> ).  |
| affect           | Data sets of affect and arousal scores as a function of personality and movie conditions ( <a href="#">Smillie, Cooper, Wilt &amp; Revelle, 2012</a> )                                  |
| income           | US family income from US census 2008  |
| bfi              | 25 Personality items representing 5 factors (N=2800)  |
| blot             | Bond's Logical Operations Test - BLOT (N=150) ( <a href="#">Bond, 1995</a> )  |
| burt             | 11 emotional variables from <a href="#">Burt (1915)</a>   |
| cities           | Distances between 11 US cities  |
| epi.bfi          | 13 scales from the Eysenck Personality Inventory and Big 5 inventory  |
| income           | US family income from US census 2008  |
| msq              | 75 mood items from the Motivational State Questionnaire for N=3896  |
| neo              | NEO correlation matrix from the NEOPI-R manual ( <a href="#">Costa &amp; McCrae, 1985</a> )   |
| sat.act          | 3 Measures of ability: SATV, SATQ, ACT (N=700)  |
| Thurstone        | Seven data sets showing a bifactor solution.  |
| veg (vegetables) | Paired comparison of preferences for 9 vegetables ( <a href="#">Guilford, 1954</a> )  |

4 steps: read, explore, test, graph

## Reading data from another program –using the clipboard

1. Read the data in your favorite spreadsheet or text editor
2. Copy to the clipboard
3. Execute the appropriate `read.clipboard` function with or without various options specified

```
my.data <- read.clipboard() #assumes headers and tab or space deli  
my.data <- read.clipboard.csv() #assumes headers and comma delimit  
my.data <- read.clipboard.tab() #assumes headers and tab delimited  
                                (e.g., from Excel)
```

```
my.data <- read.clipboard.lower() #read in a matrix given the lower  
my.data <- read.clipboard.upper() # or upper off diagonal  
my.data <- read.clipboard.fwf() #read in data using a fixed format  
                                (see read.fwf for instructions)
```

4. `read.clipboard()` has default values for the most common cases and these do not need to be specified. Consult `?read.clipboard` for details. In particular, are headers provided for each column of input?

4 steps: read, explore, test, graph

## Reading from a local or remote file

1. Perhaps the standard way of reading in data is using the `read` command.
    - First must specify the location of the file
    - Can either type this in directly or use the `file.choose` function. This goes to your normal system file handler.
    - The file name/location can be a remote URL.
  2. Two examples of reading data

## 2. Two examples of reading data

R code

```
file.name <- file.choose() #this opens a window to allow you find the file  
#or  
file.name="http://personality-project.org/r/datasets/R.appendix1.data"  
my.data <- read.table(file.name)  
#or  
my.data = read.table(file.name,header=TRUE)    #the conventional way  
dim(my.data) #find the dimensionality of our data  
describe(my.data) #describe it to check the means, ranges, etc.
```

```

> dim(my.data) #what are the dimensions of what we read?
[1] 18 2
> describe(my.data) #do the data look right?
   var n  mean    sd median trimmed mad min max range skew kurtosis    se
Dosage*   1 18  1.89 0.76      2  1.88 1.48     1   3      2 0.16 -1.12 0.18
Alertness 2 18 27.67 6.82     27  27.50 8.15    17  41     24 0.25 -0.68 1.61

```

4 steps: read, explore, test, graph

## Put it all together: read, show, describe

R code

```
datafilename="http://personality-project.org/r/datasets/R.appendix1.data"
data.ex1<- read.file(datafilename)
dim(data.ex1) #what are the dimensions of what we read?
data.ex1 #show the data
headTail(data.ex1) #just the top and bottom lines
describe(data.ex1) #descriptive stats
```

Dosage Alertness

```
1     a      30
2     a      38
...  (rows deleted by hand)
17    c      20
18    c      19
```

```
> headTail(data.ex1) #just the top and bottom lines
```

Dosage Alertness

```
1     a      30
2     a      38  'head' rows
3     a      35
4     a      41
...  <NA>    ... (rows automatically deleted)
15    c      17
16    c      21
17    c      20  'tail' rows
18    c      19
```

```
> describe(data.ex1) #descriptive stats
```

|           | vars | n  | mean  | sd   | median | trimmed | mad  | min | max | range | skew | kurtosis | se   |
|-----------|------|----|-------|------|--------|---------|------|-----|-----|-------|------|----------|------|
| Dosage*   | 1    | 18 | 1.89  | 0.76 | 2      | 1.88    | 1.48 | 1   | 3   | 2     | 0.16 | -1.35    | 0.18 |
| Alertness | 2    | 18 | 27.67 | 6.82 | 27     | 27.50   | 8.15 | 17  | 41  | 24    | 0.25 | -1.06    | 1.61 |

1. Read the data from a remote file
2. Show all the cases (problematic if there are are 100s – 1000s)
3. Just show the first and last (4) lines
4. Find descriptive statistics

## Foreign files

## However, some might want to Import SAS or SPSS files

The first thing to try is the `read.file` function. For more complicated data sets, there are several different packages that make importing SPSS, SAS, Systat, etc. files possible to do.

`read.file` Function in `psych` to read .txt, .csv, .sav, .xpt, .r, .rda, .text (etc.)

`foreign` Read data stored by Minitab, S, SAS, SPSS, Stata, Systat, Weka, dBase. Comes installed with R.  
Somewhat complicated syntax.

`haven` Reads/writes SPSS and Stata files. Handles SPSS labels nicely (keeps the item labels, but converts the data to factors).

`rio` A general purpose package that requires installation of many of the other packages used for data import. Easiest to use, but overkill if just reading in one type of file. Basically a front end to many import/export packages. It determines which package to use based

## Foreign files

## Read a “foreign” file e.g., an SPSS sav file, using foreign package

`read.spss` Reads a file stored by the SPSS save or export commands. (The defaults lead to problems, make sure to specify that you want `use.value.labels = FALSE`, `to.data.frame = TRUE`)

```
read.spss(file, use.value.labels = FALSE, to.data.frame = TRUE,  
          max.value.labels = Inf, trim.factor.names = FALSE,  
          trim_values = TRUE, reencode = NA, use.missing = to.data.frame)
```

`file` Character string: the name of the file or URL to read.

`use.value.labels` Convert variables with value labels into R factors with those levels?  
Should be `FALSE`

`to.data.frame` return a data frame? Defaults to `FALSE`, probably should be `TRUE` in most cases.

`max.value.labels` Only variables with value labels and at most this many unique values will be converted to factors if `use.value.labels = TRUE`.

`trim.factor.names` Logical: trim trailing spaces from factor levels?

`trim_values` logical: should values and value labels have trailing spaces ignored when matching for `use.value.labels = TRUE`?

`use.missing` logical: should information on user-defined missing values be used to set the corresponding values to NA?

## Foreign files

## An example of reading from an SPSS file using foreign

```
> library(foreign)  
  
> datafilename <- "http://personality-project.org/r/datasets/finkel.sav"  
  
> eli <- read.spss(datafilename,to.data.frame=TRUE,  
                      use.value.labels=FALSE)  
  
> headTail(eli,2,2)  
> describe(eli,skew=FALSE)
```

## Foreign files

## read.file as a convenient solution to reading files

- Combines file.choose and read.table
- Also, based upon the suffix of the data, will choose the most likely way to read a SPSS, csv, text, rds or SAS export file.
- Not as powerful as *foreign* or *rio* but easier.
- Automatically reads SPSS .sav files as numeric values but can read them with the item `information` as well.

```
eli <- read.file(). #goes off and searches for a local file
datafilename <- "http://personality-project.org/r/datasets/finkel.sav"
eli <- read.file(datafilename). #uses that remote address to get it
ashley <- read.file() #a file from Ashley Kendall on my computer
kendall <- read.file(read.file(use.value.labels=TRUE) #keep the labels
ashley[1:3,8:17]
kendall[1:3,8:17]
```

```
ashley[1:3,8:17]
  HighNA LowPA LowNA Active Alert Nervs Frust Worried Irrit Stress
1     8     3     0     1     0     1     2     0     3     2
2     6     1     0     0     2     0     3     0     2     1
3     1     7     0     3     3     1     0     0     0     0
> kendall[1:3,8:17]

2     6     1     0 not at all  2 not at all very much  0 somewhat a little
3     1     7     0 very much  3 a little not at all  0 not at all not at all
```

Foreign files

## Simulate data (Remember to always call them simulated!)

For many demonstration purposes, it is convenient to generate simulated data with a certain defined structure. The *psych* package has a number of built in simulation functions. Here are a few of them.

### 1. Simulate various item structures

`sim.congeneric` A one factor congeneric measure model

`sim.items` A two factor structure with either simple structure or a circumplex structure.

`sim.rasch` Generate items for a one parameter IRT model.

`sim.irt` Generate items for a one-four parameter IRT Model

### 2. Simulate various factor structures

`sim.simplex` Default is a four factor structure with a three time point simplex structure.

`sim.hierarchical` Default is 9 variables with three correlated factors.

## Graphic displays

## Get the data and look at them

Read in some data, look at the first and last few cases (using `headTail`), and then get basic descriptive statistics. For this example, we will use a built in data set.

**R code**

```
headTail(epi.bfi)
```

|     | epiE | epiS | epiImp | epilie | epiNeur | bfagree | bfcon | bfext | bfneur | bfopen | bdi | traitanx | stateanx |
|-----|------|------|--------|--------|---------|---------|-------|-------|--------|--------|-----|----------|----------|
| 1   | 18   | 10   | 7      | 3      | 9       | 138     | 96    | 141   | 51     | 138    | 1   | 24       | 22       |
| 2   | 16   | 8    | 5      | 1      | 12      | 101     | 99    | 107   | 116    | 132    | 7   | 41       | 40       |
| 3   | 6    | 1    | 3      | 2      | 5       | 143     | 118   | 38    | 68     | 90     | 4   | 37       | 44       |

References

## Graphic displays

An alternative display is a 'violin' plot (available as `violinBy`)

Density plot

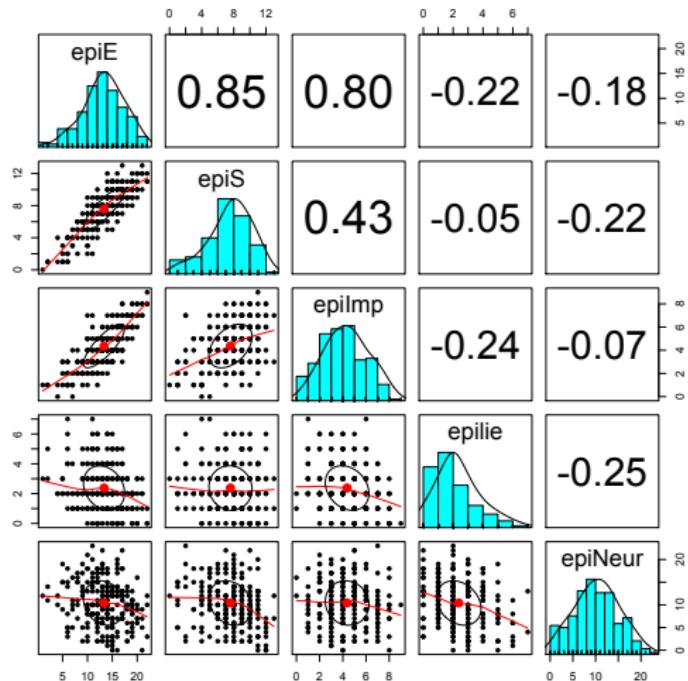

Use the `violinBy` function from *psych*

`violinBy(my.data[1:5])`

## Graphic displays

Plot the scatter plot matrix (SPLOM) of the first 5 variables using the `pairs.panels` function. Note that the plotting points overlap because of the polytomous nature of the data.

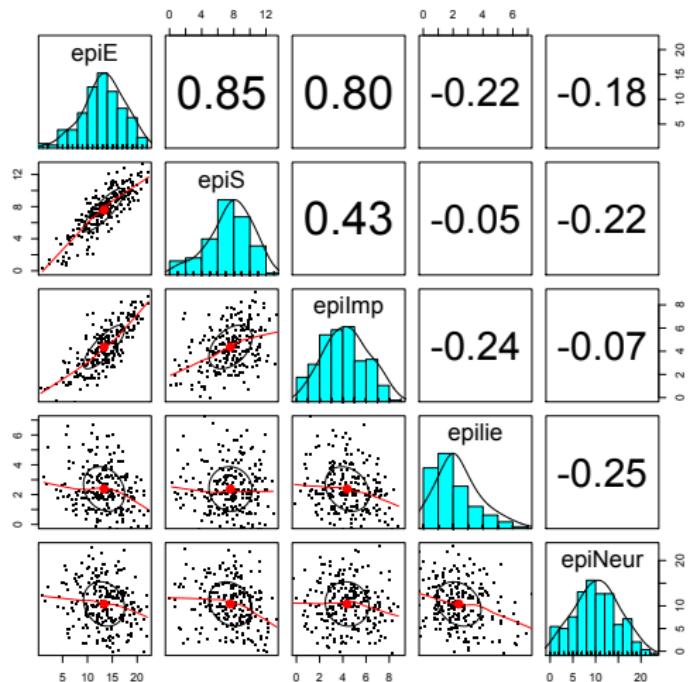

Use the `pairs.panels` function from *psych*

```
pairs.panels(my.data[1:5])
```

## Graphic displays

Plot the scatter plot matrix (SPLOM) of the first 5 variables using the pairs.panels function but with smaller plot character (pch) and jittering the points in order to better show the distributions.

Use the pairs.panels function from *psych*

```
pairs.panels(my.data[1:5], pch='.',  
jiggle=TRUE)
```

## Correlations

Find the correlations for this data set, round off to 2 decimal places.

Because we have some missing data, we use “pairwise complete” correlations. For the purists amongst us, it is irritating that the columns are not equally spaced.

R code

```
round(cor(my.data, use = "pairwise"), 2)
```

## Correlations

Find the correlations for this data set, round off to 2 decimal places  
using lowerCor

This is just a wrapper for `round(cor(x,use='pairwise'),2)` that has been prettied up with `lowerMat`.

R code

```
lowerCor(my.data)
```

## The t-test

## t.test demonstration with Student's data using cushny dataset

William Gossett, publishing under the name Student reported a small sample approximation (*t*) to the large sample *z* test. His first example was a data set on the different effect of optical isomers of hyoscyamine hydrobromide reported by [Cushny & Peebles \(1905\)](#). The sleep of 10 patients was measured without any drug and then following administration of D. and L isomers. The data from Cushny are available as the *cushny* data set.

| Variable | Cntrl | drug1 | drg2L | drg2R | delt1 | dlt2L | dlt2R |
|----------|-------|-------|-------|-------|-------|-------|-------|
| 1        | 0.60  | 1.3   | 2.50  | 2.10  | 0.70  | 1.90  | 1.50  |
| 2        | 3.00  | 1.4   | 3.80  | 4.40  | -1.60 | 0.80  | 1.40  |
| 3        | 4.70  | 4.5   | 5.80  | 4.70  | -0.20 | 1.10  | 0.00  |
| 4        | 5.50  | 4.3   | 5.60  | 4.80  | -1.20 | 0.10  | -0.70 |

| 6        | 3.20  | 6.6   | 7.60  | 8.30  | 3.40  | 4.40  | 5.10  |
| 7        | 2.50  | 6.2   | 8.00  | 8.20  | 3.70  | 5.50  | 5.70  |
| 8        | 2.80  | 3.6   | 4.40  | 4.30  | 0.80  | 1.60  | 1.50  |
| 9        | 1.10  | 1.1   | 5.70  | 5.80  | 0.00  | 4.60  | 4.70  |
| 10       | 2.90  | 4.9   | 6.30  | 6.40  | 2.00  | 3.40  | 3.50  |
| Mean     | 3.25  | 4.0   | 5.58  | 5.57  | 0.75  | 2.33  | 2.32  |
| Sd       | 1.78  | 2.1   | 1.66  | 1.91  | 1.79  | 2.00  | 2.27  |

R code

```
error.bars(cushny,xlab="Group",ylab="hours of sleep",
main="The effect of drug upon sleep (95% confidence)")
```

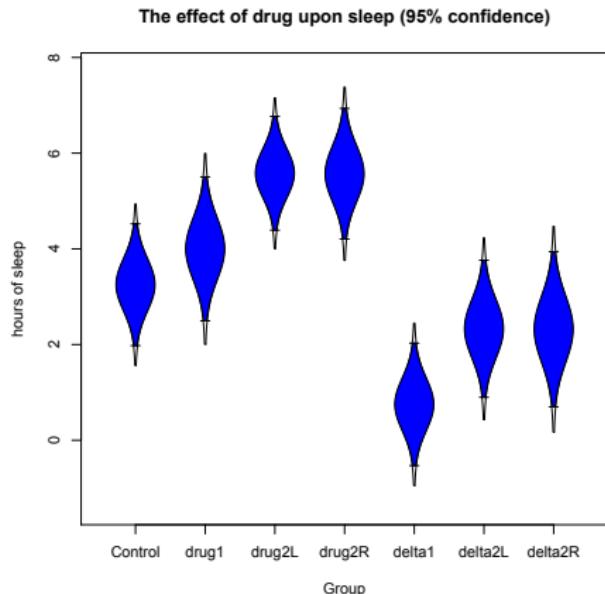

## The t-test

## The cushny data set with error bars (Cushny &amp; Peebles, 1905)

R code

```
error.bars(cushny, xlab="Group", ylab="hours of sleep",
           main="The effect of drug upon sleep (95% confidence)")
```

We can show these data graphically using the `error.bars` function. We pass labels to the x and y axis using the `xlab` and `ylab` parameters, and then supply an appropriate figure title.

We will use these data to show how to do t-tests as well as the generalization to Analysis of Variance.

## The t-test

## Student's t.test: As done by Student

R code

```
with(cushny,t.test(delta1)) #control versus drug 1 difference scores
with(cushny,t.test(delta2L)) #control versus drug2L difference scores
with(cushny,t.test(delta1,delta2L,paired=TRUE)) #difference of differences
```

```
> with(cushny,t.test(delta1)) #control versus drug 1 difference scores
   One Sample t-test
data: delta1
t = 1.3257, df = 9, p-value = 0.2176
alternative hypothesis: true mean is not equal to 0
95 percent confidence interval:
-0.5297804  2.0297804
sample estimates:
mean of x
 0.75

with(cushny,t.test(delta2L)) #control versus drug2L difference scores
   One Sample t-test
data: delta2L
t = 3.6799, df = 9, p-value = 0.005076
alternative hypothesis: true mean is not equal to 0
95 percent confidence interval:
 0.8976775 3.7623225
sample estimates:
mean of x
 2.33

> with(cushny,t.test(delta1,delta2L,paired=TRUE)) #difference of differences
   Paired t-test
data: delta1 and delta2L
t = -4.0621, df = 9, p-value = 0.002833
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
-2.4598858 -0.7001142
```

## The t-test

## Two ways of organizing the data: Wide versus long

We can take the wide format of the `cushny` data set and make it long.

|    |      | values | ind     |
|----|------|--------|---------|
| 1  | 0.7  | 0.7    | delta1  |
| 2  | -1.6 | -1.6   | delta1  |
| 3  | -0.2 | -0.2   | delta1  |
| 4  | -1.2 | -1.2   | delta1  |
| 5  | -0.1 | -0.1   | delta1  |
| 6  | 3.4  | 3.4    | delta1  |
| 7  | 3.7  | 3.7    | delta1  |
| 8  | 0.8  | 0.8    | delta1  |
| 9  | 0.0  | 0.0    | delta1  |
| 10 | 2.0  | 2.0    | delta1  |
|    |      |        | delta2L |
| 11 | 1.9  | 1.9    | delta2L |
| 12 | 0.8  | 0.8    | delta2L |
| 13 | 1.1  | 1.1    | delta2L |
| 14 | 0.1  | 0.1    | delta2L |
| 15 | -0.1 | -0.1   | delta2L |
| 16 | 4.4  | 4.4    | delta2L |
| 17 | 5.5  | 5.5    | delta2L |
| 18 | 1.6  | 1.6    | delta2L |
| 19 | 4.6  | 4.6    | delta2L |
| 20 | 3.4  | 3.4    | delta2L |

**R code**

```
long.sleep <-  
  stack(cushny[c("delta1", "delta2L")])  
long.sleep
```

## The t-test

**R code**

```
long.sleep <-
+   stack(cushny[c("delta1",
+                 "delta2L")])
```

```
> long.sleep
  values      ind
1     0.7    delta1
2    -1.6    delta1
3    -0.2    delta1
4    -1.2    delta1
5    -0.1    delta1
6     3.4    delta1
7     3.7    delta1
8     0.8    delta1
9     0.0    delta1
10    2.0    delta1
11    1.9  delta2L
12    0.8  delta2L
13    1.1  delta2L
14    0.1  delta2L
15   -0.1  delta2L
16    4.4  delta2L
17    5.5  delta2L
18    1.6  delta2L
19    4.6  delta2L
20    3.4  delta2L
```

**R code**

```
t.test(values ~ ind,data=long.sleep)
```

```
Welch Two Sample t-test
data: values by ind
t = -1.8608, df = 17.776, p-value = 0.07939
alternative hypothesis: true difference in means is not equal to zero
95 percent confidence interval:
-3.3654832  0.2054832
sample estimates:
mean in group delta1 mean in group delta2L
          0.75                  2.33
```

But, the data were paired

**R code**

```
t.test(values ~ ind,data=long.sleep,
       paired=TRUE)
```

```
data: values by ind
t = -4.0621, df = 9, p-value = 0.002833
alternative hypothesis: true difference in means is not equal to zero
95 percent confidence interval:
-2.4598858 -0.7001142
sample estimates:
mean of the differences
                  -1.58
```

## The t-test

## t.test demonstration with Student's data (from the sleep dataset)

Sleep data set is  
just 2 columns of  
cushny

R code  
sleep

```
> sleep
   extra group ID
1    0.7     1  1
2   -1.6     1  2
3   -0.2     1  3
4   -1.2     1  4
5   -0.1     1  5
6    3.4     1  6
7    3.7     1  7
8    0.8     1  8
9    0.0     1  9
10   2.0    1 10

```

R code

```
with(sleep,t.test(extra~group))
with(sleep,t.test(extra~group,var.equal=TRUE))
```

```
Welch Two Sample t-test
data: extra by group
t = -1.8608, df = 17.776, p-value = 0.07939 <-- default value
t = -1.8608, df = 18, p-value = 0.07919. <- equal variances
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
-3.3654832 0.2054832
sample estimates:
mean in group 1 mean in group 2
          0.75          2.33
```

But the data were actually paired. Do it for a paired t-test

R code

```
with(sleep,t.test(extra~group,paired=TRUE))
```

```
Paired t-test
data: extra by group
t = -4.0621, df = 9, p-value = 0.002833
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
-2.4598858 -0.7001142
sample estimates:
mean of the differences
                           -1.58
```

## Analysis of Variance as special case of linear model

1. `aov` provides a wrapper to `lm` for fitting linear models to balanced or unbalanced experimental designs.
2. The main difference from `lm` is in the way `print`, `summary` and so on handle the fit: this is expressed in the traditional language of the analysis of variance rather than that of linear models.
3. If the formula contains a single `Error` term, this is used to specify error strata, and appropriate models are fitted within each error stratum.
4. The formula can specify multiple responses.
5. `aov` is designed for balanced designs, and the results can be hard to interpret without balance: beware that missing values in the response(s) will likely lose the balance.
6. If there are two or more error strata, the methods used are statistically inefficient without balance, and it may be better to use `lme` in package `nlme`.
