## Part I Background to Psychological Measurement

<b>1</b>	<b>Introduction</b> . . . . .	5
1.1	An overview of the book . . . . .	6
1.1.1	Constructs and measures (Chapter 2) . . . . .	6
1.1.2	A theory of data (Chapter 2) . . . . .	9
1.1.3	Basic summary statistics – problems of scale (Chapter 3) . . . . .	9
1.1.4	Covariance, regression, and correlation (Chapter 4) . . . . .	10
1.1.5	Classical theory and the Measurement of Reliability (Chapter 6) . . . . .	10
1.1.6	Latent Trait Theory - The “New Psychometrics” (Chapter 7) . . . . .	11
1.1.7	Validity (Chapter 8) . . . . .	11
1.1.8	Factor, Principal Components and Cluster Analysis (Chapter 9) . . . . .	12
1.1.9	Exploratory versus Confirmatory models . . . . .	12
1.1.10	Structural Equation Modeling (Chapter 10) . . . . .	12
1.1.11	Scale construction (Chapter 16) . . . . .	12
1.1.12	Appendix – Basic R . . . . .	13
1.1.13	Appendix - Review of Matrix algebra . . . . .	13
1.2	General comments . . . . .	13
<b>2</b>	<b>A Theory of Data</b> . . . . .	15
2.1	A Theory of Data: Objects, People, and Comparisons . . . . .	15
2.1.1	Modeling the comparison process . . . . .	16
2.2	Models and model fitting . . . . .	16
2.3	A brief diversion: Functions in R . . . . .	18
2.4	Tournaments: Ordering people ( $p_i > p_j$ ) . . . . .	19
2.4.1	Scaling of People . . . . .	20
2.4.2	Alternative approaches to scaling people . . . . .	22
2.4.3	Assigning numbers to people – the problem of rewarding merit . . . . .	23
2.5	Social Networks: Proximities of People ( $ p_i - p_j  < \delta$ ) . . . . .	24
2.5.1	Rectangular data arrays of similarity . . . . .	24
2.5.2	Square arrays of similarity . . . . .	24
2.6	The Scaling of Objects ( $o_i < o_j$ ) . . . . .	27
2.6.1	Weber-Fechner scales of subjective experience . . . . .	27
2.6.2	Thurstonian Scaling . . . . .	29

2.6.3	Alternative solutions to the ranking of objects	33
2.6.4	Why emphasize Thurstonian scaling?	34
2.7	Multiple Dimensional Scaling: Distances between Objects ( $ o_i - o_j  <  o_k - o_l $ )	34
2.8	Preferential Choice: Unfolding Theory ( $ s_i - o_j  <  s_k - o_l $ )	37
2.8.1	Individual Preferences – the I scale	38
2.8.2	Joint Preferences – the J scale	39
2.8.3	Partially ordered metrics	39
2.8.4	Multidimensional Unfolding	39
2.9	Measurement of Attitudes and Abilities (comparing $s_i, o_j$ )	40
2.9.1	Measurement of abilities ( $s_i > o_j$ )	41
2.9.2	Measurement of attitudes ( $ s_i - o_j  < \delta$ )	44
2.10	Theory of Data: some final comments	44
<b>3</b>	<b>The problem of scale</b>	<b>47</b>
3.0.1	Factor levels as Nominal values	49
3.0.2	Integers and Reals: Ordinal or Metric values?	49
3.1	Graphical and numeric summaries of the data	50
3.1.1	Sorting data as a summary technique	51
3.2	Numerical estimates of central tendency	51
3.2.1	Mode: the most frequent	52
3.2.2	Median: the middle observation	53
3.2.3	3 forms of the mean	55
3.2.4	Comparing variables or groups by their central tendency	57
3.3	The effect of non-linearity on estimates of central tendency	58
3.4	Whose mean? The problem of point of view	58
3.4.1	Average length of time in psychotherapy	60
3.4.2	Average class size	60
3.5	Non-linearity and interpretation of experimental effects	60
3.6	Measures of dispersion	63
3.6.1	Measures of range	63
3.6.2	Average distance from the central tendency	64
3.6.3	Deviation scores and the standard deviation	66
3.6.4	coefficient of variation	67
3.7	Geometric interpretations of Variance and Covariance	67
3.8	Variance, Covariance, and Distance	68
3.9	Standard scores as unit free measures	69
3.10	Assessing the higher order moments of the normal and other distributions	70
3.11	Generating commonly observed distributions	75
3.12	Mixed distributions	75
3.13	Robust measures of dispersion	76
3.14	Monotonic transformations of data and “Tukey’s ladder”	78
3.15	What is the fundamental scale?	79
<b>4</b>	<b>Covariance, Regression, and Correlation</b>	<b>81</b>
4.1	Correlation as the geometric mean of regressions	84
4.2	Regression and prediction	86
4.3	A geometric interpretation of covariance and correlation	87
4.4	The bivariate normal distribution	89

4.4.1	Confidence intervals of correlations . . . . .	89
4.4.2	Testing whether correlations differ from zero . . . . .	90
4.4.3	Testing the difference between correlations . . . . .	91
4.5	Other estimates of association . . . . .	94
4.5.1	Pearson correlation equivalents . . . . .	95
4.6	Other measures of association . . . . .	102
4.6.1	Naturally dichotomous data . . . . .	102
4.6.2	Cohen's Kappa . . . . .	106
4.6.3	Intraclass Correlation . . . . .	107
4.6.4	Quantile Regression . . . . .	108
4.6.5	Kendall's Tau . . . . .	108
4.7	Alternative Estimates of effect size . . . . .	109
4.8	Sources of confusion . . . . .	110
4.8.1	Restriction of range . . . . .	110
4.8.2	Spurious correlations . . . . .	110
4.8.3	Base rates and skew . . . . .	113
4.8.4	Non linearity, outliers and other problems: the importance of graphics . . . . .	115
<b>5</b>	<b>Multiple correlation and multiple regression . . . . .</b>	<b>117</b>
5.1	The variance of composites . . . . .	117
5.2	Multiple regression . . . . .	118
5.2.1	Interactions and product terms . . . . .	120
5.2.2	Confidence intervals of the regression and regression weights . . . . .	120
5.2.3	Multiple regression from the covariance/correlation matrix . . . . .	120
5.2.4	The robust beauty of linear models . . . . .	120
5.3	Partial Correlation – classical versus structural interpretations . . . . .	121
5.4	Robust regression using M estimators . . . . .	121
 <b>Part II Classical and Modern Test Theory</b>		
<b>6</b>	<b>Classical Test Theory and the Measurement of Reliability . . . . .</b>	<b>127</b>
6.1	Reliability and True Scores . . . . .	128
6.1.1	Parallel Tests . . . . .	128
6.1.2	Tau equivalent and congeneric tests . . . . .	128
6.2	Domain Sampling Theory . . . . .	128
6.2.1	Correlation of a test with the domain . . . . .	128
6.2.2	Coefficients alpha, beta, and omega . . . . .	128
6.3	Generalizability theory . . . . .	128
6.3.1	Reliability of what . . . . .	128
6.4	More on reliability . . . . .	128
6.4.1	Reliability of a composite test . . . . .	128
6.4.2	Reliability of a difference score . . . . .	128
<b>7</b>	<b>The “New Psychometrics” – Item Response Theory . . . . .</b>	<b>129</b>
7.1	Monotonic trace lines: the measurement of ability . . . . .	129
7.1.1	Rasch Modeling - one parameter IRT . . . . .	129
7.1.2	Two and Three parameter models . . . . .	129
7.1.3	IRT and factor analysis of items . . . . .	129

7.2	Test bias and Differential Item Functioning . . . . .	129
7.3	Non-monotone trace lines – the measurement of attitudes . . . . .	129
7.3.1	Unfolding theory revisited . . . . .	129
7.3.2	Political choice . . . . .	129
<b>8</b>	<b>Validity . . . . .</b>	<b>131</b>
8.1	Types of validity . . . . .	131
8.1.1	Face or Faith . . . . .	131
8.1.2	Concurrent and Predictive . . . . .	131
8.1.3	Construct . . . . .	131
8.2	Validity and cross validation . . . . .	132
8.2.1	Cross validation . . . . .	132
8.2.2	Resampling and cross validation . . . . .	132
8.3	Validity: an alternative perspective . . . . .	132
8.4	Validity for what? . . . . .	132
8.4.1	Validity for the institution . . . . .	132
8.4.2	validity for the individual . . . . .	132
8.5	Validity and decision making . . . . .	132

### Part III Latent Variable Models

<b>9</b>	<b>Constructs, Components, and Factor models . . . . .</b>	<b>137</b>
9.1	Principal Components: an observed variable model . . . . .	139
9.1.1	Eigenvalues and Eigenvectors . . . . .	139
9.1.2	Principal components . . . . .	141
9.2	Exploratory Factor Analysis: a latent variable model . . . . .	141
9.2.1	Principal Axes Factor Analysis as an eigenvalue decomposition of a reduced matrix . . . . .	143
9.2.2	Maximum Likelihood Factor Analysis . . . . .	144
9.2.3	Exploratory analysis with more than one factor/component . . . . .	146
9.2.4	Comparing factors and components- part 1 . . . . .	147
9.3	Rotations and Transformations . . . . .	147
9.3.1	Orthogonal rotations . . . . .	152
9.3.2	Oblique transformations . . . . .	152
9.3.3	Non-Simple Structure Solutions: The Simplex and Circumplex . . . . .	153
9.3.4	Hierarchical and higher order models . . . . .	155
9.3.5	Comparing factor solutions . . . . .	158
9.4	The number of factors/components problem . . . . .	159
9.5	The number of subjects problem . . . . .	163
9.6	Confirmatory Factor Analysis . . . . .	164
9.7	Alternative procedures for reducing the complexity of the data . . . . .	166
9.7.1	MDS solutions remove the general factor . . . . .	167
9.7.2	Cluster analysis – poor man’s factor analysis? . . . . .	168
9.8	Estimating factor scores, finding component and cluster scores . . . . .	174
9.8.1	Comparing factors and components – part 2 . . . . .	177

<b>10 Simulating latent variables</b> .....	179
10.1 Simulate one latent variable and n observed variables .....	179
10.1.1 generate the data in a function .....	181
10.2 SEM for one sample from the population .....	182
10.2.1 a smaller sample .....	184
10.2.2 multiple simulations - varying sample size .....	185
10.3 Statistics for a more complicated model .....	187
10.3.1 Fitting a 1 factor model to two factor data .....	188
10.3.2 fitting a 2 factor model to two factor data .....	190
10.3.3 A set of simulations for the two factor model .....	192
<b>11 Testing alternative models of data</b> .....	193
11.1 One factor — congeneric data model .....	193
11.1.1 Generating the data .....	193
11.1.2 Estimate a congeneric model .....	196
11.1.3 Estimate a tau equivalent model with equal true score and unequal error loadings .....	197
11.1.4 Estimate a parallel test model with equal true score and equal error loadings .....	198
11.1.5 Estimate a parallel test model with fixed loadings .....	200
11.1.6 Comparison of models .....	201
11.2 Two (perhaps correlated) factors .....	201
11.2.1 Generating the data .....	201
11.2.2 Exploratory Factor analysis of the data .....	203
11.2.3 Confirmatory analysis with a predicted structure .....	205
11.2.4 Confirmatory factor analysis with two independent factors with equal loadings within factors .....	207
11.2.5 Structure invariance, part I— unequal loadings within factors - matched across factors .....	208
11.2.6 Estimate two correlated factors .....	210
11.3 Hierarchical models .....	217
11.3.1 Two Correlated factors with a g factor .....	217
11.3.2 Generating the data for 3 correlated factors .....	220
11.3.3 Exploratory factor analysis with 3 factors .....	221
11.3.4 Three correlated factors with a g factor .....	223
11.3.5 Bifactor solutions .....	225
11.3.6 Schmid Leiman transformations to orthogonalize the factors .....	228
11.3.7 Omega as an estimate of reliability .....	230
<b>12 sem in R and in LISREL</b> .....	231
12.1 Example data set 1: 9 cognitive variables (from Rakov and Marcoulides) .....	231
12.2 Using R to analyze the data set .....	233
12.2.1 An initial formulation is empirically underidentified .....	233
12.2.2 Adjusting to model to converge .....	234
12.2.3 Modifying the model to improve the fit .....	236
12.2.4 Changing from a regression model to a correlation model .....	238
12.3 Using LISREL to analyze the data set .....	240
12.3.1 Instructions for using the SSCC .....	242

12.3.2	Modify the model to allow for correlated errors . . . . .	249
12.4	Comparing the R and LISREL output . . . . .	257
12.5	Testing for factorial invariance . . . . .	257
12.5.1	Testing for factorial equivalence in multiple groups . . . . .	259
<b>13</b>	<b>Further issues: Item quality</b> . . . . .	<b>261</b>
13.1	Continuous, ordinal, and dichotomous data . . . . .	261
13.2	Simple structure versus circumplex structure . . . . .	261
13.3	Data generation using the circ.sim function . . . . .	262
13.4	Simple structure - normal items . . . . .	262
13.4.1	5 categories of responses . . . . .	267
13.4.2	3 categories of responses . . . . .	269
13.4.3	dichotomous items . . . . .	275
13.5	Circumplex structure - normal items . . . . .	279
13.5.1	Fitting a circumplex data set with a simple structure model . . . . .	281
13.5.2	An alternative model . . . . .	284
13.6	Simple Structure - categorical and skewed items . . . . .	287
13.6.1	Two dimensions with 4 point scales, differing in skew . . . . .	287
13.6.2	An alternative model of two bipolar dimensions . . . . .	292
13.7	Forming clusters or homogeneous item composites . . . . .	297
<b>14</b>	<b>Evaluating models</b> . . . . .	<b>303</b>
14.1	Model misspecification: failure to include variables . . . . .	303
14.1.1	Misspecified Linear Regression . . . . .	304
14.1.2	Regression with the correct variables included . . . . .	305
14.1.3	Misspecified Structural Equation Models . . . . .	307
14.1.4	Three predictors - alternative models . . . . .	311
14.1.5	Three predictors, model the correlations with one latent variable . . . . .	317
14.1.6	Three predictors with shared “error” . . . . .	319
14.1.7	Reverse the causal paths . . . . .	323
14.2	Including the correct variables, but misspecifying the models . . . . .	324
14.2.1	Including the correct variables in linear regression . . . . .	325
14.2.2	Including the correct variables in the Structural Equation . . . . .	327
14.2.3	Direct the causal path . . . . .	330
14.3	Measures of fit . . . . .	336
14.3.1	$\chi^2$ . . . . .	336
14.3.2	GFI, NFI, . . . . .	336
14.3.3	RMSEA . . . . .	336
14.4	What does it mean to fit a model . . . . .	336
<b>15</b>	<b>Multidimensional Scaling and Mult-Mode Methods</b> . . . . .	<b>337</b>
15.1	Basic models of Multidimensional Scaling . . . . .	337
15.2	Measuring Individual Differences in MDS . . . . .	337
15.2.1	INDSCAL and ALSCAL . . . . .	337

## Part IV The construction of tests and the analysis of data

<b>16 Basic issues in scale construction— An example</b> .....	341
16.1 Steps towards scale construction .....	341
16.2 Scale analysis: part 1: analyzing the dimensionality of the items .....	341
16.3 Preliminary steps .....	342
16.3.1 Data checking .....	342
16.4 Data reduction through factor analysis .....	343
16.4.1 Background: eigen values and eigen vectors .....	343
16.4.2 Principal Components .....	343
16.4.3 Factor analysis .....	344
16.4.4 Estimating the number of components or factors to extract .....	344
16.5 Factor analysis of the data set .....	346
16.5.1 Principal Components .....	346
16.5.2 Factor Analysis .....	347
16.5.3 Simple Structure .....	348

## Part V Appendices

<b>A R: Getting started</b> .....	353
A.1 R: A statistical programming environment .....	353
A.2 General comments .....	354
A.3 Using R in 10 simple steps .....	355
A.4 Getting started .....	356
A.4.1 Installing R on your computer .....	356
A.4.2 Useful additions to R .....	356
A.4.3 Help and Guidance .....	356
A.5 Basic R commands and syntax .....	357
A.5.1 data structures .....	357
A.6 Entering or getting the data .....	357
A.7 Basic descriptive statistics .....	358
A.7.1 Using functions in the psych package .....	359
A.8 Simple Graphics .....	361
<b>B R commands</b> .....	363
B.1 Input and display .....	363
B.2 moving around .....	364
B.3 data manipulation .....	364
B.4 Statistics and transformations .....	364
B.5 Useful additional commands .....	365
B.6 Graphics .....	365
<b>C R examples</b> .....	369
C.1 Chapter 4 .....	369
<b>D Particularly useful packages</b> .....	371
D.1 psych by William Revelle .....	371
D.2 sem by John Fox .....	371
D.3 ltm by Dimitris Rizopoulos .....	371
D.4 GPArotation by Bollen and Jennrich .....	371

D.5	robust	371
D.6	nlme: non-linear mixed effects by xxx	371
D.7	psy	371
D.8	multilevel	372
D.9	Rgraphviz	372
D.10	foreign	372
<b>E</b>	<b>Appendix: A Review of Matrices</b>	<b>373</b>
E.1	Vectors	373
E.1.1	Vector multiplication	374
E.1.2	Simple statistics using vectors	375
E.1.3	Combining vectors with <code>cbind</code> and <code>rbind</code>	377
E.2	Matrices	378
E.2.1	Adding or multiplying a vector and a Matrix	379
E.2.2	Matrix multiplication	381
E.2.3	Finding and using the diagonal	384
E.2.4	The Identity Matrix	385
E.2.5	Matrix Inversion	385
E.2.6	Eigenvalues and Eigenvectors	386
E.2.7	Determinants	387
E.3	Matrix operations for data manipulation	387
E.3.1	Matrix operations on the raw data	388
E.3.2	Matrix operations on the correlation matrix	390
E.3.3	Using matrices to find test reliability	390
E.4	Multiple correlation	392
E.4.1	Data level analyses	392
<b>F</b>	<b>More on Matrices</b>	<b>395</b>
F.1	Multiple regression as a system of simultaneous equations	395
F.2	Matrix representation of simultaneous equation	396
F.2.1	Finding the inverse of a 2 x 2 matrix	396
F.3	A numerical example of finding the inverse	398
F.4	Examples of inverse matrices	399
F.4.1	Inverse of an identity matrix	399
F.4.2	The effect of correlation size on the inverse	400
<b>G</b>	<b>Simulation as a tool for research</b>	<b>403</b>
G.1	Simulating one latent variable and multiple observed	403
G.2	Simulation of experimental manipulations	403
G.3	Simulating multiple latent variables with a known structure	403
<b>H</b>	<b>Appendix: R code for figures</b>	<b>405</b>
H.1	Chapter-2	405
H.2	Chapter 3	406

<b>I</b>	<b>Classics in measurement</b> .....	407
I.1	Diameter of the earth .....	407
I.2	The period of a pendulum .....	407
I.3	Oil, water, and Avogadro's Number .....	407
I.4	Measuring reaction time by holding hands .....	407
I.5	Dropping torn paper: Measuring the intensity of a nuclear explosion by dropping paper .....	407
I.6	Beer cans: Measuring the wave height produced by a nuclear explosion .....	408
I.7	Timing waves: Discovering the source of the California summer surf .....	408
	<b>References</b> .....	409
	<b>Index</b> .....	420
