

# Psychology 454: Latent Variable Modeling

## Week 4: Latent models of real data

William Revelle

Department of Psychology  
Northwestern University  
Evanston, Illinois USA

NORTHWESTERN  
UNIVERSITY

October, 2015

## Outline

### Example data sets

- Getting real data – either from examples or your own

- First, a brief diversion with simulation

### Thurstone 9 variable problem

- Factor extraction: how many and what algorithm

- Various Rotations or Transformations

### Confirmatory fits

- Using sem

- Bifactor models

- Confirmatory Bifactor model

### Holzing 14 cognitive variables

### Using lavaan

- Traditional analyses of the Holzinger Swineford data set

- SEM analysis of Holzinger Swineford data set

```

```

## Real data rather than simulated

1. Prior examples were all artificial data sets.
  - These have the advantage that we know truth.
  - They have the disadvantage that they don't give us experience with real data.
2. Some classic data sets are available in *psych*, *lavaan* and *sem*.
3. Using the data function to see what is available.
  - `data(package="psych")`
4. Eventually, you need to try your own data.

## Some of the psych data sets

*data (package="psych")*

|                           |                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------|
| Bechtoldt                 | Seven data sets showing a bifactor solution.                                                               |
| Bechtoldt.1               | Seven data sets showing a bifactor solution.                                                               |
| Bechtoldt.2               | Seven data sets showing a bifactor solution.                                                               |
| Chen (Schmid)             | 12 variables created by Schmid and Leiman to show the Schmid-Leiman Transformation                         |
| Dwyer                     | 8 cognitive variables used by Dwyer for an example.                                                        |
| Gorsuch                   | Example data set from Gorsuch (1997) for an example factor extension.                                      |
| Harman.5                  | 5 socio-economic variables from Harman (1967)                                                              |
| Harman.8                  | Correlations of eight physical variables (from Harman, 1966)                                               |
| Harman.Burt (Harman)      | Two data sets from Harman (1967). 9 cognitive variables from Holzinger and 8 emotional variables from Burt |
| Harman.Holzinger (Harman) | Two data sets from Harman (1967). 9 cognitive variables from Holzinger and 8 emotional variables from Burt |
| Holzinger                 | Seven data sets showing a bifactor solution.                                                               |
| Holzinger.9               | Seven data sets showing a bifactor solution.                                                               |
| Reise                     | Seven data sets showing a bifactor solution.                                                               |
| Schmid                    | 12 variables created by Schmid and Leiman to show the Schmid-Leiman Transformation                         |
| Thurstone                 | Seven data sets showing a bifactor solution.                                                               |
| Thurstone.33              | Seven data sets showing a bifactor solution.                                                               |
| Tucker                    | 9 Cognitive variables discussed by Tucker and Lewis (1973)                                                 |
| West (Schmid)             | 12 variables created by Schmid and Leiman to show the Schmid-Leiman Transformation                         |
| all.income (income)       | US family income from US census 2008                                                                       |
| bfi                       | 25 Personality items representing 5 factors                                                                |
| blot                      | Bonds Logical Operations Test - BLOT                                                                       |
| bock.table (bock)         | Bock and Liberman (1970) data set of 1000 observations of the LSAT                                         |

## More of the psych data sets

|                        |                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------|
| burt                   | 11 emotional variables from Burt (1915)                                                                          |
| cities                 | Distances between 11 US cities                                                                                   |
| city.location (cities) | Distances between 11 US cities                                                                                   |
| cubits                 | Galtons example of the relationship between height and cubit or forearm length                                   |
| cushny                 | A data set from Cushny and Peebles (1905) on the effect of three drugs on hours of sleep, used by Student (1908) |
| epi.bfi                | 13 personality scales from the Eysenck Personality Inventory and Big 5 inventory                                 |
| flat (affect)          | Two data sets of affect and arousal scores as a function of personality and movie conditions                     |
| galton                 | Galton Mid parent child height data                                                                              |
| heights                | A data.frame of the Galton (1888) height and cubit data set.                                                     |
| income                 | US family income from US census 2008                                                                             |
| iqitems                | 16 multiple choice IQ items                                                                                      |
| lsat6 (bock)           | Bock and Liberman (1970) data set of 1000 observations of the LSAT                                               |
| lsat7 (bock)           | Bock and Liberman (1970) data set of 1000 observations of the LSAT                                               |
| maps (affect)          | Two data sets of affect and arousal scores as a function of personality and movie conditions                     |
| msq                    | 75 mood items from the Motivational State Questionnaire for 3896 participants                                    |
| neo                    | NEO correlation matrix from the NEO_PI_R manual                                                                  |
| peas                   | Galtons Peas                                                                                                     |
| sat.act                | 3 Measures of ability: SATV, SATQ, ACT                                                                           |
| schmid.leiman (Schmid) | 12 variables created by Schmid and Leiman to show the Schmid-Leiman Transformation                               |
| veg (vegetables)       | Paired comparison of preferences for 9 vegetables                                                                |
| withinBetween          | An example of the distinction between within group and between group correlations                                |

```

```

## Data sets in sem and lavaan

```

data(package='sem')
data(package='lavaan')

```

Data sets in package 'sem':

```

Bollen      Bollen's Data on Industrialization and Political Democracy
CNES        Variables from the 1997 Canadian National Election Study
Klein       Klein's Data on the U. S. Economy'
Kmenta      Partly Artificial Data on the U. S. Economy

```

Data sets in package 'lavaan':

```

Demo.growth      Demo dataset for a illustrating a linear growth model.
HolzingerSwineford1939  Holzinger and Swineford Dataset (9 Variables)
PoliticalDemocracy  Industrialization And Political Democracy Dataset

```

## Also can read in from clipboard, web, from hard drive and import

- To read from clipboard: `read.clipboard()`
  - `read.clipboard(header = TRUE, ...)` #assumes headers and tab or space delimited
  - `read.clipboard.csv(header=TRUE,sep=',',...)` #assumes headers and comma delimited
  - `read.clipboard.tab(header=TRUE,sep='^',...)` #assumes headers and tab delimited
  - `read.clipboard.lower(diag=TRUE,names=FALSE,...)` #read in a matrix given the lower off diagonal
  - `read.clipboard.upper(diag=TRUE,names=FALSE,...)`
  - `read.clipboard.fwf(header=FALSE,widths=rep(1,10),...)` #read in data using a fixed format width (see `read.fwf` for instructions)
- To read from a file
  - `fn <- file.choose()` #this opens the system directory – navigate it to your file
  - `my.data <- read.table(fn)`

## More on getting your data

```
#specify the name and address of the remote file
datafilename <- "http://personality-project.org/r/datasets/maps.mixx.epi.bfi.data"
#datafilename <- Desktop/epi.big5.txt #read from local directory or
# datafilename <- file.choose()      # use the OS to find the file
#in all cases
person.data <- read.table(datafilename,header=TRUE) #read the data file

#Alternatively, to read in a comma delimited file:
#person.data <- read.table(datafilename,header=TRUE,sep=",")

names(person.data) #list the names of the variables

library(foreign) #allows you to read SPSS files e.g.,
datafilename <- "/Users/bill/Library/Favorites/R.tutorial/datasets/finkel.sav" #local file
eli.data <- read.spss(datafilename, use.value.labels=TRUE, to.data.frame=TRUE)
```

## Use the bifactor examples

The study of latent variable models in general and sem in particular is the combination of measurement models with structural models. The bifactor examples are useful to understand issues in reliability and estimating measurement models.

```
data(Thurstone)
data(Thurstone.33)
data(Holzinger)
data(Holzinger.9)
data(Bechtoldt)
data(Bechtoldt.1)
data(Bechtoldt.2)
data(Reise)
data(Chen)
data(West)
```

Two more data sets with similar structures are found in the Harman data set.

```
Bechtoldt.1: 17 x 17 correlation matrix of ability tests, N = 212.
Bechtoldt.2: 17 x 17 correlation matrix of ability tests, N = 213.
Holzinger: 14 x 14 correlation matrix of ability tests, N = 355
Holzinger.9: 9 x 9 correlation matrix of ability tests, N = 145
Reise: 16 x 16 correlation matrix of health satisfaction items. N = 35,000
Thurstone: 9 x 9 correlation matrix of ability tests, N = 213
Thurstone.33: Another 9 x 9 correlation matrix of ability items, N=4175
```

## Simulate a bifactor model using `sim.structure`

First, make up a bifactor model and then simulate it. We use the `sim.structure` function with a specified factor loadings matrix.

R code

```
f <- matrix(c(.8, .75, .7, .65, .6, .65, .7, .8, .9, .5, .6, .5,
              rep(0,9), .6, .5, .4, rep(0,9), .6, .5, .4), ncol=4)
f
```

```
      [,1] [,2] [,3] [,4]
[1,] 0.80 0.5 0.0 0.0
[2,] 0.75 0.6 0.0 0.0
[3,] 0.70 0.5 0.0 0.0
[4,] 0.65 0.0 0.6 0.0
[5,] 0.60 0.0 0.5 0.0
[6,] 0.65 0.0 0.4 0.0
[7,] 0.70 0.0 0.0 0.6
[8,] 0.80 0.0 0.0 0.5
[9,] 0.90 0.0 0.0 0.4
```

## Simulate the data

R code

```
R <- sim.structure(f,n=500)
```

```
R
```

```
Call: sim.structure(fx = f, n = 500)
      $model (Population correlation matrix)
           V1  V2  V3  V4  V5  V6  V7  V8  V9

## lavaan gets the right answer (if we help)

R code

```
library(lavaan)
bi.mod <- 'g =~ V1 + V2 + V3 + V4 + V5 + V6 + V7 + V8 + V9
          F1 =~ V1 + V2 + V3
          F2 =~ V4 + V5 + V6
          F3 =~ V7 + V8 + V9'
bi.cfa <- cfa(model=bi.mod,sample.cov=R$model,sample.nobs=500,
              orthogonal=TRUE,std.lv=TRUE)
summary(bi.cfa)
```

lavaan (0.5-19) converged normally after 42 iterations

## Number of factors?

```

> fa.parallel(Thurstone,n.obs=213)
> vss <- VSS(Thurstone,n.obs=213,SMC=FALSE)
> vss

```

```

Parallel analysis suggests that the number of factors = 3 and
                                the number of components = 1

```

Very Simple Structure

```
Call: VSS(x = Thurstone, n.obs = 213, SMC = FALSE)
```

```
VSS complexity 1 achieves a maximum of 0.86 with 1 factors
```

```
VSS complexity 2 achieves a maximum of 0.91 with 2 factors
```

The Velicer MAP criterion achieves a minimum of 0.07 with 3 factors

Velicer MAP

## 2 factor goodness of fits

Test of the hypothesis that 2 factors are sufficient.

The degrees of freedom for the null model are 36 and the objective function was 5.2 with Chi Square of 1081.97

The degrees of freedom for the model are 19 and the objective function was 0.4

The root mean square of the residuals is 0.05

The df corrected root mean square of the residuals is 0.1

The number of observations was 213 with Chi Square = 82.84  
 with prob < 6e-10

Tucker Lewis Index of factoring reliability = 0.884

RMSEA index = 0.128 and the 90 % confidence intervals are 0.127 0.130

BIC = -19.02

Fit based upon off diagonal values = 0.98

Measures of factor score adequacy

## Orthogonal Rotations and oblique Transformations

- Should the latent variables be allowed to correlate?
  - Factors as extracted are orthogonal.
  - Factors as interpreted typically are allowed to be oblique
- Consider five cases
  - unrotated: factors as extracted (rotate="none")
  - rotated using VARIMAX (or Quartimax)
  - transformed using PROCRUSTES
  - transformed using oblimin
  - transformed using geominQ

## Varimax versus Quartimax

```
> fa(Thurstone, 3, n.obs=213, rotate="varimax")
> fa(Thurstone, 3, n.obs=213, rotate="quart")
```

## Visualizing the difference: Varimax versus quartimin

Orthogonal Rotation

Oblique Transformation

## Specifying the parameters in sem using the RAM notation

- Need to specify each path
- Need to specify the error variance paths as well
  - A short cut can be done by using *psych*
  - See the vignette ‘psych for sem’ for more details
- Apply this to the Thurstone problem

## create the sem commands by using psych

```
f3 <- fa(Thurstone, 3, fm='mle')
mod3 <- structure.diagram(f3, cut=.45, errors=TRUE)
mod3
```

|       | Path        | Parameter | Value |
|-------|-------------|-----------|-------|
| [1,]  | "ML1->V1"   | "F1V1"    | NA    |
| [2,]  | "ML1->V2"   | "F1V2"    | NA    |
| [3,]  | "ML1->V3"   | "F1V3"    | NA    |

## A correlation plot to show a general factor

Thurstone 9 variable problem

## Two ways of showing a hierarchical structure

**Hierarchical (multilevel) Structure**

**Omega**

## Exploratory versus confirmatory bifactor model

- omega will do exploratory bifactoring
- omegaSem will do exploratory and then confirmatory based upon that solution.
  - This is not true “confirmatory” in that the solution was decided on in an exploratory fashion.
  - True confirmatory tests a prior hypothesis
- omegaSem reports both exploratory and confirmatory results.
- The sem model is hidden as part of the structure but may be found from the str command

## lavaan: Latent Variable Analysis

- The *lavaan* package Rosseel (2012) is a very powerful sem/cfa modeling package.
- Mimics input of LISREL and MPlus
  - Easier to set up than sem Fox, Nie & Byrnes (2013)
  - Clearly targets MPlus
  - Further help available at <http://lavaan.ugent.be/>
  - Example data sets from MPlus

oooo

## An example from lavaan

1. Holzinger Swineford data set from three schools
  - First describe the data
  - descriptive stats and graphics
2. Then consider the structure of the 9 variables
  - Using fa
  - Using sem/lavaan

## Holzinger descriptive statistics

## With goodness of fit stats

Test of the hypothesis that 3 factors are sufficient.

The degrees of freedom for the null model are 36 and the objective function was 3.05 with 0

The degrees of freedom for the model are 12 and the objective function was 0.08

The root mean square of the residuals (RMSR) is 0.01

The df corrected root mean square of the residuals is 0.03

The number of observations was 301 with Chi Square = 22.38 with prob < 0.034

Tucker Lewis Index of factoring reliability = 0.964

RMSEA index = 0.055 and the 90 % confidence intervals are 0.015 0.088

BIC = -46.11

Fit based upon off diagonal values = 1

Measures of factor score adequacy

|                                               | MR1  | MR3  | MR2  |
|-----------------------------------------------|------|------|------|
| Correlation of scores with factors            | 0.94 | 0.84 | 0.85 |
| Multiple R square of scores with factors      | 0.89 | 0.71 | 0.72 |
| Minimum correlation of possible factor scores | 0.78 | 0.42 | 0.45 |

## Weak evidence for hierarchical structure

**Omega**

## Omega analysis of Holzinger Swineford data

1.46 1.62 0.75 1.02
```

## Omega fit statistics for Holzinger Swineford

```
general/max 0.9    max/min =    2.15
mean percent general = 0.31    with sd = 0.12 and cv of 0.38
```

```
The degrees of freedom are 12 and the fit is 0.08
The number of observations was 301 with Chi Square = 22.38 with prob < 0.034
The root mean square of the residuals is 0.01
The df corrected root mean square of the residuals is 0.03
RMSEA index = 0.055 and the 90 % confidence intervals are 0.015 0.088
BIC = -46.11
```

```
Compare this with the adequacy of just a general factor and no group factors
The degrees of freedom for just the general factor are 27 and the fit is 1.75
The number of observations was 301 with Chi Square = 517.18 with prob < 4.4e-92
The root mean square of the residuals is 0.14
The df corrected root mean square of the residuals is 0.23
```

```
RMSEA index = 0.248 and the 90 % confidence intervals are 0.227 0.264
BIC = 363.09
```

Root Mean Square Error of Approximation:
    RMSEA                                  0.092
    90 Percent Confidence Interval           0.071  0.114
    P-value RMSEA <= 0.05                  0.001
```

and the parameter estimates

Parameter estimates:

Information  
Standard Errors

Expected  
Standard

| Estimate | Std.err | Z-value | P(> z ) |
|----------|---------|---------|---------|
|----------|---------|---------|---------|

Latent variables:

visual  $\approx$

|    |       |       |       |       |
|----|-------|-------|-------|-------|
| x1 | 1.000 |       |       |       |
| x2 | 0.553 | 0.100 | 5.554 | 0.000 |
| x3 | 0.729 | 0.109 | 6.685 | 0.000 |

textual  $\approx$

|    |       |       |        |       |
|----|-------|-------|--------|-------|
| x4 | 1.000 |       |        |       |
| x5 | 1.113 | 0.065 | 17.014 | 0.000 |
| x6 | 0.926 | 0.055 | 16.703 | 0.000 |

speed  $\approx$

|    |       |       |       |       |
|----|-------|-------|-------|-------|
| x7 | 1.000 |       |       |       |
| x8 | 1.180 | 0.165 | 7.152 | 0.000 |
| x9 | 1.082 | 0.151 | 7.155 | 0.000 |

Covariances:

visual ~ ~

|         |       |       |       |       |
|---------|-------|-------|-------|-------|
| textual | 0.408 | 0.074 | 5.552 | 0.000 |
| speed   | 0.262 | 0.056 | 4.660 | 0.000 |

textual ~ ~

|       |       |       |       |       |
|-------|-------|-------|-------|-------|
| speed | 0.173 | 0.049 | 3.518 | 0.000 |
|-------|-------|-------|-------|-------|

Variances:

|    |       |       |
|----|-------|-------|
| x1 | 0.549 | 0.114 |
| x2 | 1.134 | 0.102 |
| x3 | 0.844 | 0.091 |
| x4 | 0.371 | 0.048 |
| x5 | 0.446 | 0.058 |
| x6 | 0.356 | 0.043 |
| x7 | 0.799 | 0.081 |
| x8 | 0.488 | 0.074 |

Do this again, but fix the latent variable variance to 1
