

Estimating Latent Models

Part II: Exploratory and confirmatory factor models

Data = Model + Error

- I. A fundamental process in science is the modeling of data. Statistics are estimates of how well the model fits the data and reflect the size of the error
- II. Residuals = Data - Model
- III. Theoretical models attempt to represent the data
- IV. Empirical fits can be evaluated in terms of size of residuals

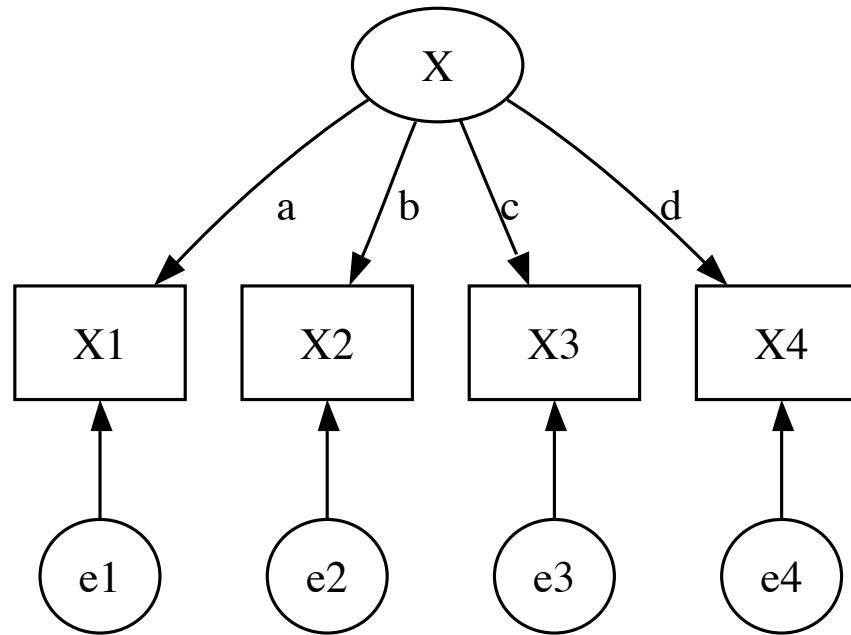

Fitting latent models

- I. Latent variable models are path (matrix) models of observed covariances
- II. Parameters are estimated by finding model parameters that minimize some criterion of misfit.
- III. Need to consider multiple multiples of data and compare adequacy of fit versus complexity of the model

Know the fundamentals

- I. An understanding of the fundamental concepts allows one to derive the applications

The basic congeneric test model

Example data

	V1	V2	V3	V4
V1	1.00	0.54	0.52	0.41
V2	0.54	1.00	0.41	0.32
V3	0.52	0.41	1.00	0.32
V4	0.41	0.32	0.32	1.00

The 1 factor model

```
path label initial estimate
[1,] "theta -> V1" "a" NA
[2,] "theta -> V2" "b" NA
[3,] "theta -> V3" "c" NA
[4,] "theta -> V4" "d" NA
[5,] "V1 <-> V1" "u" NA
[6,] "V2 <-> V2" "v" NA
[7,] "V3 <-> V3" "w" NA
[8,] "V4 <-> V4" "x" NA
[9,] "theta <-> theta" NA "1"
```

Model statistics

Unstandardized paths

Factor invariance

- I. Are the factor loadings in the first scale the same as the factor loadings in the second scale?
- II. (Usually asked if the two measures are thought to be measures of the same construct and are highly correlated)
- III. Test the model of equality of ordered loadings (e.g., $a=d$, $b=e$, $c=f$)

Model factor invariance

Very Simple Structure

I. VSS as a quasi confirmatory model

A. Fit the factor model as interpreted

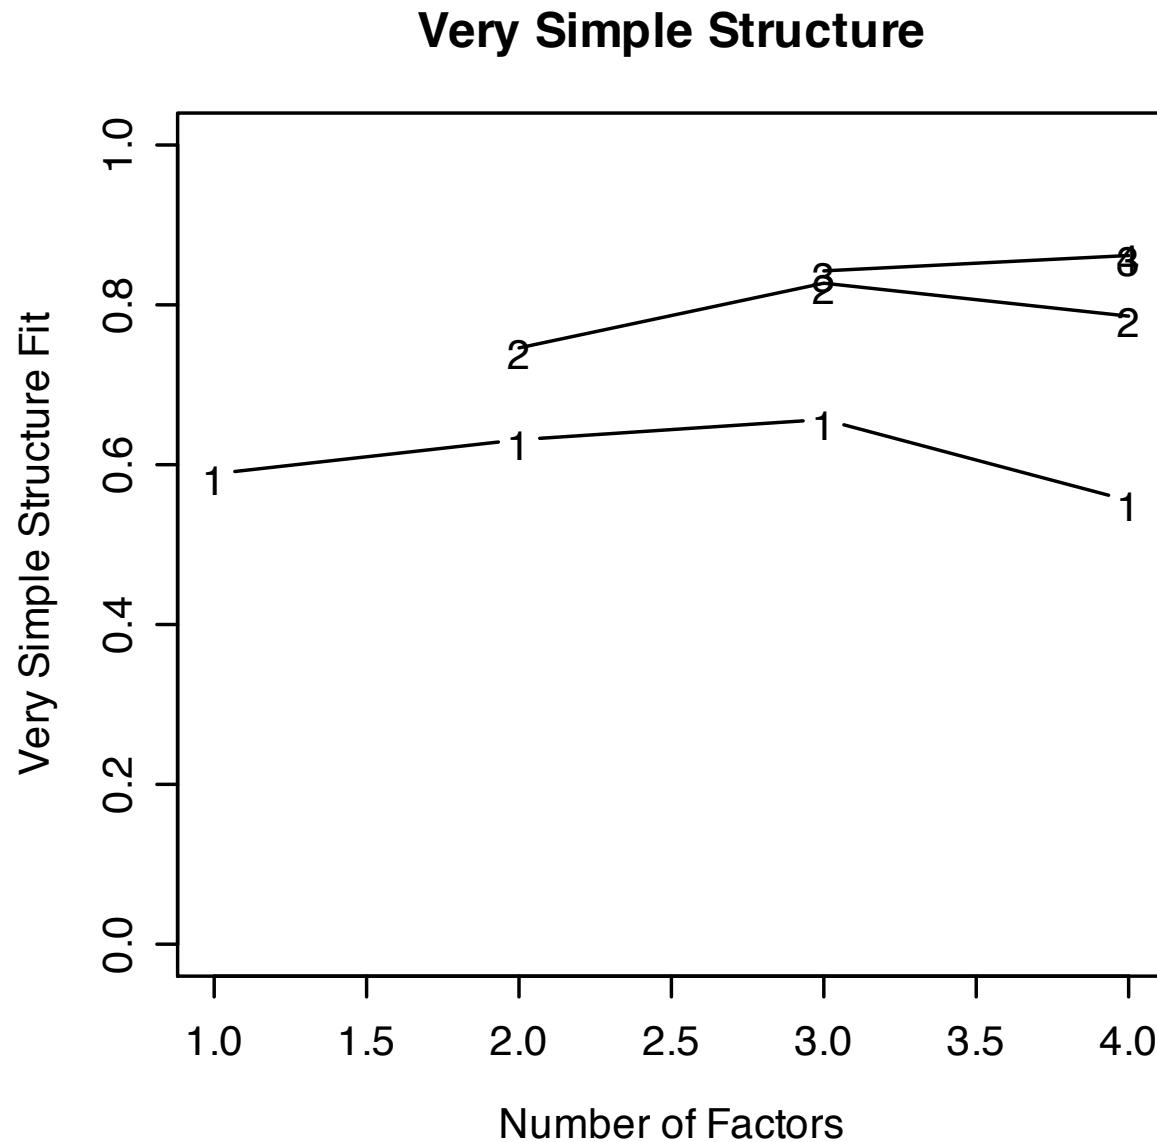

1. keep big loadings
2. reject small loading

B. Try alternative number of factors

$$\text{II. } \mathbf{R} \approx \mathbf{F} \mathbf{F}' + \mathbf{U}^2$$

$$\mathbf{R} \approx \mathbf{F}_s \mathbf{F}_s' + \mathbf{U}^2$$

Very Simple Structure

Extract 3 factors

Loadings:

	Factor1	Factor2	Factor3
V1	0.809	-0.358

Bi-factor model

From correlated to bifactor: The Schmid Leiman

- I. Extract n factors
- II. Rotate obliquely
- III. Factor their intercorrelations
- IV. Extract g from this matrix
- V. Remove g from each item (following path rules)

Schmid Leiman

	g factor	Factor1	Factor2	Factor3	h2	u2
V1	0.50	0.73331	0.01326	0.0070	0.77	0.23

Summary

- I. Exploratory factor analysis as a way of representing latent variables in the data
- II. Confirmatory factor analysis as a way of “testing” model fit of latent variables in the data
- III. Multiple representations (hierarchical, bifactor) of similar structures
